KEY FIGURES

PRELIMINARY DATA

	Population at end Dec qtr 2013 '000	Change over previous year '000	Change over previous year %
New South Wales	7 465.5	110.3	1.5
Victoria	5 791.0	107.9	1.9
Queensland	4 690.9	79.7	1.7
South Australia	1 677.3	15.2	0.9
Western Australia	2 550.9	71.3	2.9
Tasmania	514.0	1.5	0.3
Northern Territory	242.6	4.0	1.7
Australian Capital Territory	384.1	6.1	1.6
Australia (a)	23 319.4	396.2	1.7

(a) Includes Other Territories comprising Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.

KEY POINTS

ESTIMATED RESIDENT POPULATION

- The preliminary estimated resident population (ERP) of Australia at 31 December 2013 was 23,319,400 people. This reflects an increase of 396,200 people since 31 December 2012 and 85,100 people since 30 September 2013.
- The preliminary estimates of natural increase recorded for the year ended 31 December 2013 (160,400 people) was 0.9%, or 1,400 people lower than the natural increase recorded for the year ended 31 December 2012 (161,800 people).
- The preliminary estimates of net overseas migration (NOM) recorded for the year ended 31 December 2013 (235,800 people) was 2.2%, or 5,400 people lower than the net overseas migration recorded for the year ended 31 December 2012 (241,200 people).

POPULATION GROWTH RATES

- Australia's population grew by 1.7% during the year ended 31 December 2013.
- Natural increase and NOM contributed 40% and 60% respectively to total population growth for the year ended 31 December 2013.
- All states and territories recorded positive population growth in the year ended 31 December 2013. Western Australia continued to record the fastest growth rate of all states and territories at 2.9%. Tasmania recorded the slowest growth rate at 0.3%.

NOTES

FORTHCOMING ISSUES

<i>ISSUE (Quarter)</i>	<i>RELEASE DATE</i>

CHANGES IN THIS ISSUE

Population estimates for major population regions in Table 5 have been updated to include 2013 data.

Aboriginal and Torres Strait Islander Population estimates and projections in Table 10 have been updated to include data from the 2011 Census rebasing and recasting processes.

HOUSEHOLD ESTIMATES AND PROJECTIONS

An estimate of the number of households for each state, territory and Australia based on the 2011 Census will be released as a supplementary table in this publication in July 2014.

MAIN FEATURES COMMENTARY

ANNUAL POPULATION CHANGE – YEAR ENDING 31 DECEMBER 2013

AUSTRALIA: POPULATION AND GROWTH

The preliminary estimated resident population (ERP) of Australia at 31 December 2013 was 23,319,400 people. This reflects an increase of 396,200 people since 31 December 2012 and 85,100 people since 30 September 2013.

The annual population growth rate for the year ended 31 December 2013 was 1.7%.

ANNUAL POPULATION GROWTH RATE(a)(b), Australia

(a) Annual growth calculated at the end of each quarter.

(b) Estimates prior to 30 September 2011 are final. Estimates for 30 September 2011 to 30 June 2012 are revised. Estimates thereafter are preliminary.

COMPONENTS OF POPULATION CHANGE

The growth of Australia's population has two components: natural increase (the number of births minus the number of deaths) and net overseas migration (NOM).

The contribution to population growth for the year ended 31 December 2013 was higher from net overseas migration (60%) than from natural increase (40%). This remained stable from the previous year ending 31 December 2012.

COMPONENTS OF ANNUAL POPULATION GROWTH(a)(b), Australia

(a) Annual components calculated at the end of each quarter.

(b) Estimates prior to 30 September 2011 are final. Estimates for 30 September 2011 to 30 June 2012 are revised. Estimates thereafter are preliminary.

(c) NOM estimates have been calculated using a range of methods over the period, and include a break in series at 30 September 2006 – see paragraphs 12–19 of the Explanatory Notes.

Natural Increase

The preliminary estimated natural increase for the year ended 31 December 2013 was 160,400 people, a decrease of 0.9%, or 1,400 people, compared with natural increase for the year ended 31 December 2012 (161,800 people).

BIRTHS

The preliminary estimate of births for the year ended 31 December 2013 (308,100 births) decreased slightly, decreasing by 1,500 births from the year ended 31 December 2012 (309,600 births).

DEATHS

The preliminary estimate of deaths for the year ended 31 December 2013 (147,700 deaths) remained fairly stable, decreasing by 100 deaths from the year ended 31 December 2012 (147,800 deaths).

Net Overseas Migration

For the year ended 31 December 2013, Australia's preliminary net overseas migration (NOM) estimate was 235,800 people. This was 2.2% (5,400 people) lower than the net overseas migration estimated for the year ended 31 December 2012 (241,200 people).

NOM arrivals increased by 1.3% (6,700 people) between the years ended 31 December 2012 (497,100 people) and 31 December 2013 (503,800 people).

NOM departures increased by 4.7% (12,000 people) between the years ended 31 December 2012 (255,900 people) and 31 December 2013 (268,000 people).

The preliminary net overseas migration estimate for the December quarter 2013 (49,000 people) was 9.6% (5,200 people) lower than the estimate for the December quarter 2012 (54,200 people).

**STATES AND
TERRITORIES:
POPULATION AND
GROWTH**

The estimated resident population for each state and territory at 31 December 2013 was as follows:

- New South Wales 7,465,500;
- Victoria 5,791,000;
- Queensland 4,690,900;
- South Australia 1,677,300;
- Western Australia 2,550,900;
- Tasmania 514,000;
- Northern Territory 242,600; and
- Australian Capital Territory 384,100.

All states and territories recorded positive population growth in the year ended 31 December 2013. Western Australia continued to record the fastest growth rate of all states and territories at 2.9%. Tasmania recorded the slowest growth rate at 0.3%.

COMPONENTS OF
POPULATION CHANGE

At the state and territory level, population growth has three components: natural increase, net overseas migration and net interstate migration.

Although all states and territories experienced positive population growth in the year ended 31 December 2013, the proportion that each of these components contributed to population growth varied between the states and territories.

For the year ended 31 December 2013, natural increase was the major component of population change in Tasmania and the Australian Capital Territory. Net overseas migration was the major component of population change in New South Wales, Victoria, Queensland, South Australia, Western Australia and the Northern Territory. Net interstate migration losses were recorded in New South Wales, South Australia, Tasmania, the Northern Territory and the Australian Capital Territory.

Natural Increase

BIRTHS

The total number of births registered for the year ended 31 December 2013 decreased in most states and territories when compared to the previous year. The largest percentage increase of registered births was recorded in the Australian Capital Territory at 2.6% (an increase of 140 births). This was followed by Western Australia (1.7%) and New South Wales (1.2%). The remaining states and territories recorded decreases in numbers of births. The largest percentage decrease of registered births was recorded in Victoria, decreasing by 3.3% (2,500 births), followed by Queensland (down 1.2%), Tasmania (down 0.9%), the Northern Territory (down 0.8%) and South Australia (down 0.1%). For more information, see table 13.

DEATHS

The total number of deaths registered for the year ended 31 December 2013 decreased slightly for most of the states and territories when compared to the previous year. The largest percentage decrease was recorded in South Australia, decreasing by 2.5% (330 deaths). This was followed by the Australian Capital Territory (down 1.0%), New South Wales (down 0.5%), Tasmania (down 0.2%) and Queensland (down 0.1%). Increases in registered deaths were recorded for the remaining states and territories with the largest percentage increase recorded in the Northern Territory at 12.7% (120 deaths). For more information, see table 14.

Estimates of births and deaths are subject to fluctuations caused by lags or accumulations in the reporting of birth and death registrations (for more information see paragraphs 10–11 of the Explanatory Notes).

Net Overseas Migration

All states and territories recorded positive net overseas migration (NOM) for the year ending 31 December 2013. However, only half of the states and territories recorded an increase in NOM when compared with the previous year. New South Wales recorded the largest increase over the last four quarters at 9,600 people (15.6%), followed by Victoria at 5,200 people (9.1%). Moderate increases were recorded for South Australia (up 700 people) and Tasmania (up 100 people). The largest decrease in NOM was recorded in Western Australia, decreasing by 11,200 people (19.8%), followed by Queensland at 8,800 people (19.1%). Moderate decreases were recorded for the Northern Territory and the Australian Capital Territory (both down 500 people). For more information, see table 16.

MAIN FEATURES COMMENTARY *continued*

Net Overseas Migration *continued*

NOM ARRIVALS

Compared with the previous year ended 31 December 2012, most states and territories recorded increases in NOM arrivals. New South Wales recorded the largest percentage and increase at 7.4% (11,200 people), followed by Victoria at 6.6% (7,700 people). Moderate increases were recorded for South Australia (up 3.3%), Tasmania (up 3.2%) and the Northern Territory (up 1.9%). The largest decrease was recorded for Western Australia at 7,800 people (8.8%), followed by Queensland (down 5,000 people) and the Australian Capital Territory (400 people). For more information, see table 16.

NOM DEPARTURES

Compared with the previous year ended 31 December 2012, all states and territories recorded increases in NOM departures except for Tasmania, which recorded a slight decrease of 1.1%. The largest increase was recorded for Queensland at (3,800 people) (7.5%). This was closely followed by Western Australia (3,400 people) and Victoria (2,500 people). For more information, see table 16.

Net Interstate Migration

Victoria recorded the highest gains from net interstate migration (NIM) for the year ended 31 December 2013 (7,500 people), closely followed by Queensland (6,900 people) and Western Australia (4,800 people). Net losses from interstate migration were recorded in New South Wales (11,200 people), South Australia (3,900 people), the Northern Territory (2,200 people), Tasmania (1,500 people) and the Australian Capital Territory (400 people). For more information, see table 17.

- (a) For further information on each component of population change, see the Explanatory Notes.
- (b) Estimates of births, deaths and natural increase prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised based on quarter of occurrence and are no longer subject to revisions until rebasing. Estimates for 30 September 2012 onwards are preliminary, based on quarter of registration and may fluctuate from quarter to quarter due to delays and subsequent recovery in registry processing, and are subject to revision – see paragraphs 7–11 of the Explanatory Notes.
- (c) NOM estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 September 2012 they are revised, based on actual traveller behaviour and are no longer subject to revision. Estimates for 31 December 2012 onwards are preliminary, based on modelled traveller behaviour and are subject to revisions – see paragraphs 7 and 12–19 of the Explanatory Notes.
- (d) Estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised and are no longer subject to revisions until rebasing. Estimates for 30 September 2012 onwards are preliminary and are subject to revisions – see paragraph 7 of the Explanatory notes.
- (e) Differences between growth on previous year and the sum of the components of population change prior to 30 September 2011 are due to final intercensal difference.

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) Natural increase estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised based on quarter of occurrence and are no longer subject to revisions until final rebasing. Estimates for 30 September 2012 onwards are preliminary, based on quarter of registration, and may fluctuate from quarter to quarter due to delays and subsequent recovery in registry processing, and are subject to revisions – see paragraphs 7–11 of the Explanatory Notes.

(c) NOM estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 September 2012 they are revised, based on actual traveller behaviour and are no longer subject to revisions. Estimates for 31 December 2012 and onwards are preliminary, based on modelled traveller behaviour and are subject to revisions – see paragraphs 7 and 12–19 of the Explanatory Notes.

.. not applicable

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) Net interstate migration estimates prior to 30 September 2011 are final. For 30 September 2011 onwards they are preliminary, based on 2011 Census expansion factors, and will only be revised following the 2016 Census – see paragraphs 21–26 of the Explanatory Notes.

(c) Differences between total population growth and the sum of the components of population change prior to 30 September 2011 are due to final intercensal difference.

(d) Estimates of total population growth prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised and are no longer subject to revision until rebasing. Estimates for 30 September 2012 onwards are preliminary and are subject to revisions – see paragraph 7 of the Explanatory Notes.

.. not applicable

— nil or rounded to zero (including null cells)

(a) Total population growth rate broken down into its three components.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Net interstate migration estimates prior to 30 September 2011 are final.

For 30 September 2011 onwards they are preliminary, based on 2011

Census expansion factors, and will only be revised following the 2016

Census – see paragraphs 21–26 of the Explanatory Notes.

(d) Estimates of total population growth prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised and are no longer subject to revisions until rebasing. Estimates for 30 September 2012 and onwards are preliminary, and are subject to revisions – see paragraph 7 of the Explanatory Notes.

— nil or rounded to zero (including null cells)

(a) Estimates are based on the Australian Statistical Geography Standard (ASGS) boundaries.

(b) Based on data published in *Regional Population Growth, Australia, 2012–13* (cat. no. 3218.0), released on 3 April 2014.

(c) For more information on Greater Capital City Statistical Areas and Significant Urban Areas, see *Australian Statistical Geography Standard (ASGS): Volume 1 – Main Structure and Greater Capital City Statistical Areas, July 2011* (cat. no. 1270.0.55.001) and *Australian Statistical Geography Standard (ASGS): Volume 4 – Significant Urban Areas, Urban Centres and Localities, Section of State, July 2011* (cat. no. 1270.0.55.004).

(d) Estimates to 30 June 2012 are final. Estimates for 30 June 2013 and onwards are preliminary.

ESTIMATED RESIDENT POPULATION, by sex and age groups—States and territories—at 30 June 2013(a)

Age group (years)	New South Wales	Victoria	Queensland	South Australia	Western Australia	Tasmania	Northern Territory	Australian Capital Territory	Australia (b)

.. not applicable

(a) Uses preliminary Estimated Resident Population at 30 June 2012 as the base population – see paragraphs 31–36 of the Explanatory Notes. For further information see *Population Projections, Australia, 2012 (base) to 2101* (cat. no. 3222.0).

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Series A assumes high levels of fertility, overseas migration and life expectancy, and large interstate migration flows.

(d) Series B assumes medium levels of fertility, overseas migration, life expectancy, and interstate migration flows.

(e) Series C assumes low levels of fertility and overseas migration, medium life expectancy, and small interstate migration flows.

(a) These estimates and projections use final rebased Estimates at 30 June 2011 as the base population – see paragraph 29 of the Explanatory Notes. For further information see *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026* (cat. no. 3238.0).

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Series A assumes: constant fertility rates; 2% annual increase in paternity rates (where the father of a child is Aboriginal or Torres Strait Islander but the mother is not); life expectancy at birth increasing by 0.5 years per year for males and 0.45 years per year for females, reaching 76.5 years for males and 80.4 years for females by 2026; levels of interstate migration as observed in the 2011 Census; and zero net overseas migration.

(d) Series B assumes: an annual decrease of 0.5% in fertility rates; 1% annual increase in paternity rates (where the father of a child is Aboriginal or Torres Strait Islander but the mother is not); life expectancy at birth increasing by 0.3 years per year for males and 0.25 years per year for females, reaching 73.5 years for males and 77.4 years for females by 2026; levels of interstate migration as observed in the 2011 Census; and zero net overseas migration.

(a) For information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data, see paragraphs 8-10 of the Explanatory Notes.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Birth estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised based on quarter of occurrence and are no longer subject to revisions until final rebasing – see paragraphs 7-10 of the Explanatory Notes.

(d) Birth estimates for 30 September 2012 onwards are preliminary based on quarter of registration and may fluctuate from quarter to quarter due to delays and subsequent recovery in registry processing and are subject to revision – see paragraphs 7-11 of the Explanatory Notes.

(e) Births per woman.

(f) Calculated using revised births on quarter of occurrence and revised ERP, and are no longer subject to revisions until rebasing – see paragraph 7 of the Explanatory Notes.

(g) Calculated using preliminary births on quarter of registration and preliminary ERP, and are subject to revisions – see paragraph 7 of the Explanatory Notes.

np not available for publication but included in totals where applicable, unless otherwise indicated

(a) For information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data see paragraphs 8–10 of the Explanatory Notes.

(b) Due to the small number of infant deaths in most quarters in Tasmania, the Northern Territory and the Australian Capital Territory, quarterly estimates are not available for publication.

(c) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(d) Death estimates prior to 30 September 2011 are final. From 30 September 2011 to 30 June 2012 they are revised based on quarter of occurrence and are no longer subject to revisions until rebasing – see paragraphs 7–10 of the Explanatory Notes.

(e) Death estimates for 30 September 2012 onwards are preliminary based on quarter of registration and may fluctuate from quarter to quarter due to delays and subsequent recovery in registry processing, and are subject to revisions – see paragraphs 7–11 of the Explanatory Notes.

(f) Infant deaths per 1,000 live births.

(g) Calculated using revised infant deaths and revised births, both based on quarter of occurrence, and are no longer subject to revisions until rebasing – see paragraph 7 of the Explanatory Notes.

(h) Calculated using preliminary infant deaths and preliminary births, both based on quarter of registration, and may fluctuate from quarter to quarter due to delays and subsequent recovery in registry processing, and are subject to revision – see paragraphs 7–11 of the Explanatory Notes.

- (a) Data are based on the 2006 Census – see paragraphs 37–38 of the Explanatory Notes. For further information see – Series II, *Household and Family Projections, Australia, 2006 to 2031* (cat. no. 3236.0).
- (b) Household projections based on the 2011 Census are scheduled for release in early 2015.

- (c) A table containing an estimate of the number of households for each state, territory and Australia based on the 2011 Census will be released as a supplement to the publication *Australian Demographic Statistics – December quarter* (cat. no. 3101.0) in July 2014.
- (d) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

EXPLANATORY NOTES

INTRODUCTION

1 This quarterly publication contains the most recent estimates of the resident populations (ERP) of Australia and the states and territories based on the results of the *2011 Census of Population and Housing* held on 9 August 2011 (with various adjustments described in paragraphs 5 and 6), and the addition of quarterly components of population growth. The ABS has used the 2011 Census to produce final rebased estimates of the resident population for the series from September 1991 to June 2011. This publication contains the latest available statistics on births, deaths (including infant deaths) and overseas and interstate migration. In addition, the publication includes estimates of the resident population by age groups, major population regions and estimates and projections of the Aboriginal and Torres Strait Islander population. It also includes projected resident populations and projected number of households (2006 base). Periodically, articles on specific demographic topics will be released on the ABS web site in conjunction with this publication.

2 Following the 1992 amendments to the *Acts Interpretation Act* to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state and territory level has been created, known as Other Territories. Other Territories include Jarvis Bay Territory (previously included with the Australian Capital Territory), as well as Christmas Island and the Cocos (Keeling) Islands which were previously excluded from population estimates for Australia. Data for Other and External Territories are detailed separately in table 8.

3 Estimates for Australian External Territories will be updated annually as at 30 June unless a more recent estimate is required for electoral apportionment purposes under the *Commonwealth Electoral Act 1918*.

POPULATION AND COMPONENTS OF POPULATION CHANGE

4 Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Information Paper: Population Concepts, 2008* (cat. no. 3107.0.55.006) and also in *Population Estimates: Concepts, Sources and Methods, 2009* (cat. no. 3228.0.55.001).

Method of estimation

5 The estimated resident population is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the component of natural increase (on a usual residence basis) and the component of net overseas migration. For the states and territories, estimated interstate movements involving a change of usual residence are also taken into account. Estimates of the resident population are based on Census counts by place of usual residence, to which are added the estimated Census net undercount and the number of Australian residents estimated to have been temporarily overseas at the time of the Census. Overseas visitors in Australia are excluded from this calculation.

6 After each Census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (final intercensal difference) to ensure that the total intercensal increase agrees with the difference between the estimated resident populations at the two 30 June dates in the respective Census years.

Status of quarterly ERP data

7 The status of quarterly ERP data changes over time from preliminary to revised to final as new component data becomes available. The table below shows the current status of ERP and the components of population change: natural increase, net overseas migration and net interstate migration.

EXPLANATORY NOTES *continued*

STATUS OF QUARTERLY ESTIMATED RESIDENT POPULATION (ERP) DATA, AS AT 19 JUNE 2014

	<i>Census base</i>	<i>Natural increase</i>	<i>Net overseas migration</i>	<i>Net interstate migration</i>	<i>ERP STATUS</i>
Sep.1991–Jun. 2006	Based to 1996, 2001 & 2006 Censuses as applicable	Final (Recast)	Final (Recast)	Final (Recast)	FINAL (RECAST)
Sep. 2006–Jun. 2011	2011 Census	Final	Final	Final	FINAL
Sep. 2011–Jun. 2012	2011 Census	Revised	Revised	Preliminary – modelled expansion factors based on 2011 Census	REVISED
Sep. 2012	2011 Census	Preliminary – based on date of registration	Revised	Preliminary – modelled expansion factors based on 2011 Census	PRELIMINARY
Dec. 2012–Dec. 2013	2011 Census	Preliminary – based on date of registration	Preliminary – based on modelled traveller behaviour	Preliminary – modelled expansion factors based on 2011 Census	PRELIMINARY

Note: 'Final (Recast)' refers to recast estimates based on 2011 ERP.

Natural increase: births and deaths

8 Natural increase is a major component of ABS quarterly state and territory population estimates and is calculated using the estimated number of births and deaths. The births and deaths data in this release are shown by state and territory of usual residence, using year/quarter of registration for preliminary data and year/quarter of occurrence for both revised and final data. This may affect time series comparisons within relevant tables. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates, a factor has been applied to the number of occurrences to allow for those occurrences which were yet to be registered at the time of revision. For final estimates between 30 June 1991 and 30 June 2011, year/quarter of occurrence data are used. For further details see *Demography Working Paper 1998/2 – Quarterly Birth and Death Estimates, 1998* (cat. no. 3114.0).

9 The timeliness and accuracy of ABS quarterly population estimates depend in part on the timeliness and accuracy of estimates of births and deaths which are based on registrations. To be able to provide timely estimates, the ABS produces preliminary estimates using births and deaths by quarter of registration as a proxy for quarter of occurrence. The major difficulty in this area stems from the fact that while the vast majority of births and deaths are registered promptly, a small proportion of registrations are delayed for months or even years. Lags or accumulations in births and deaths registrations can be caused by:

- late notification of a birth or death event to a state or territory registry;
- delays arising from incomplete information supplied for a registration;
- procedural changes affecting the processing cycles in any of the state and territory registries; or
- resolution of issues that may arise within the ABS or registry processing systems.

10 Preliminary birth and death estimates are subject to fluctuations caused by lags or accumulations in the reporting of births and deaths registrations. Accumulations can result from the eventual processing of lagged registrations in a later quarter. As a result, preliminary quarterly estimates can be an underestimate or an overestimate of the true numbers of births and deaths occurring in a reference period.

11 Selected birth and death registration data contributing to preliminary estimates which are higher or lower than usual have been explained by the state registrars as follows:

- December 2013: Victoria – the noticeable drop in birth registrations this quarter is due largely to a lag in processing. A more consistent pattern is likely to result when this data is revised based on occurrence rather than registration data.

EXPLANATORY NOTES *continued*

Natural increase: births and deaths continued

- December 2013: Northern Territory – the increase in death registrations compared to the same quarter in previous years is due to the processing of accumulated death registrations this quarter. It is possible that revisions based on occurrence data will result in lower numbers.
- September 2013: The high level of ACT birth registrations in this quarter continues from the previous quarter and is due largely to the processing of accumulated registrations not processed in previous quarters, particularly the March quarter 2013 where registrations were noticeably low. A more consistent pattern is likely to result when this data is revised based on occurrence rather than registration data.
- June 2013: The large increase in NSW birth registrations is due in part to the processing of accumulated registrations not processed in previous quarters. A more consistent pattern is likely to result when this data is revised based on occurrence rather than registration data.
- June 2013: The large increase in ACT birth registrations is due largely to the processing of accumulated registrations not processed in previous quarters, particularly the March quarter where registrations were noticeably low. A more consistent pattern is likely to result when this data is revised based on occurrence rather than registration data.
- March 2013: The increase in NSW death registrations is most likely due to the processing of accumulated registrations not processed in the December 2012 quarter.
- March 2013: The increase in WA birth registrations may be a result of births from earlier periods being registered in this quarter.
- March 2013: The ACT registry has indicated that the decrease in both birth and death registrations in this quarter is due to a slowdown of processing which is likely to lead to a catch up in future quarters.
- December 2012: The New South Wales registry indicated that a decrease in death registration numbers may be due to a concentration on birth registrations processing this quarter.
- September 2012: The New South Wales registry indicated that the increase in both birth and death registrations follows a general pattern of increases in the September quarter. They also indicated that birth registration increases could be associated with initiatives to assist the population of outlying areas to register births as well as general initiatives to increase awareness of the importance of birth and death registrations in outlying areas.
- September 2012: The Victorian, Western Australian, South Australian and ACT registries have advised that there were no significant changes in processing, backlog processing or staffing which could have influenced an increased level of birth and death registrations. The Victorian and Western Australian registries highlighted state initiatives to provide registration assistance as well as registration awareness raising initiatives. The ACT registry observed that a small increase in the number of coroner-certified deaths as well as a perceived increasing use of ACT health services by residents from the surrounding rural areas of NSW may have contributed to the increase in birth and death registrations.

Net overseas migration

12 According to recommendations of the United Nations, an international migrant is defined as "*any person who changes his or her country of usual residence*" (United Nations 1998). For the purposes of estimating net overseas migration (NOM), and thereby Australia's official ERP counts, a person is regarded as a usual resident if they have been (or expected to be) residing in Australia for a period of 12 months or more over a 16 month period. As such, NOM and ERP estimates include all people, regardless of nationality, citizenship or legal status, who usually live in Australia, with the exception of foreign diplomatic personnel and their families.

EXPLANATORY NOTES *continued*

Net overseas migration
continued

13 Conceptually, the term NOM is based on an international traveller's duration of stay being in or out of Australia for 12 months or more. It is the difference between the number of incoming travellers who stay in Australia for 12 months or more and are added to the population (NOM arrivals) and the number of outgoing travellers who leave Australia for 12 months or more and are subtracted from the population (NOM departures). With the introduction of the improved methods for estimating NOM, this 12 month period *does not have to be continuous* and is measured over a 16 month reference period. For example, whether a traveller is in or out of the population is determined by their exact duration of stay in or away from Australia over the subsequent 16 months after arrival or departure.

14 After reviewing the treatment of temporary migrants (both long-term and short-term) who are away from or resident in Australia for a period of 12 months or more, the ABS developed and introduced an improved NOM processing method, called the '12/16 month rule', for estimating NOM. It has been used in calculating Australia's official ERP since September quarter 2006. This represents a break in series and therefore NOM estimates from earlier periods are not comparable.

15 The current NOM estimation methods employ a '12/16 month rule' where the traveller can be added or subtracted from NOM if they have stayed in or been absent from Australia for a period of 12 months or more over a 16 month period. This period of 12 months does not have to be continuous. Although a traveller states their intended duration of stay on a passenger card, for NOM purposes the ABS now measures an individual's actual travel behaviour.

16 For further information on the improvements to NOM estimation and changes to the revision schedule for NOM, see the *Information Paper: Improving Net Overseas Migration Estimation, Mar 2010* (cat. no. 3412.0.55.001). For further information on the '12/16 month rule' methodology see the *Technical Note: '12/16 month rule' Methodology for Calculating Net Overseas Migration from September quarter 2006 onwards in Migration, Australia, 2009–10* (cat. no. 3412.0). For more detailed information, see:

- *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia, 2007* (cat. no. 3107.0.55.005);
- *Information Paper: Improved Methods for Estimating Net Overseas Migration, Australia, 2006* (cat. no. 3107.0.55.003); and
- *Information Paper: Further Improvements to Net Overseas Migration Estimation, Dec 2013* (cat. no. 3412.0.55.002).

FINAL NOM ESTIMATES

17 It is with the final NOM estimates that the '12/16 month rule' can be fully applied. A traveller's actual duration of stay can only be calculated when data on overseas movements become available for the 16 months following a reference period. Final NOM estimation methods use ERP flags to determine if a traveller, through their actual duration of stay in or out of Australia, should be included or excluded from NOM estimates and consequently ERP estimates.

PRELIMINARY NOM ESTIMATES

18 Preliminary estimates of NOM are required five to six months after the reference quarter for the production of quarterly estimates of the population of Australia, and the states and territories. At that time, complete traveller histories for the 16 months following a reference quarter cannot be produced. Migration adjustments are calculated from changes in behaviour from final estimates one year earlier for the same groups of travellers. These migration adjustments are applied to travellers who are grouped according to their 'initial category of travel', age, country of citizenship and state/territory

EXPLANATORY NOTES *continued*

Net overseas migration continued

of usual/intended residence. The adjustments account for differences between their intended duration of stay and their actual duration of stay.

19 Preliminary estimates using the improved method for estimating NOM using a 'two year ago' propensity model were used in official ABS population estimates from September quarter 2006 until June quarter 2008. Since September quarter 2008 a 'one year ago' propensity model has been used.

Diplomatic personnel

20 Australia's ERP and estimates of NOM include all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. Therefore, foreign diplomatic personnel and their families are considered out of scope and were removed from NOM estimates from 1 July 2006. The previous methodology for estimating NOM was unable to exclude diplomatic personnel and their families.

Net interstate migration

21 Interstate migration is a key determinant of the accuracy of state and territory population estimates. Data on interstate migration cannot be directly estimated. Instead, post-censal estimates of interstate migration are modelled using administrative by-product data. Currently, the data used by the ABS are information on interstate changes of address advised to Medicare Australia and to the Department of Defence in the case of the military. The Medicare-based model used for generating post-censal estimates of interstate migration is largely superseded when new Census information becomes available.

22 When Census data on interstate movement become available, part of the process of rebasing ERPs for states and territories is the re-derivation of interstate migration for the intercensal period. The overall approach is to minimise state preliminary intercensal difference using data analysed from the Census questions concerning an individual's place of residence one year ago, five years ago and on Census night. When new Census data are available, interstate migration estimates for the intercensal period are replaced with estimates derived from Census data on place of usual residence five years ago if these reduce preliminary intercensal difference. These estimates are then scaled to sum to zero at the Australian level. A similar process is carried out for the year prior to the Census, using Census data on place of usual residence one year ago. The difference between the original interstate migration estimates and the rebased estimates is apportioned across all quarters, movement categories, ages and sex categories in the intercensal period in order to minimise quarterly change.

23 Changes to the model with updated expansion factors based on Census and other Medicare data are applied after each Census. Expansion factors are used to account for an undercoverage of Medicare data by various ages and sex. The current model is essentially unchanged from the model used to estimate interstate migration between 2006 to 2011 but for updated expansion factors based on the 2011 Census. The model includes the following characteristics:

- Medicare data is lagged by three months (both for calculating expansion factors and for estimating progressive quarters of interstate migration);
- smoothed inputs used to produce expansion factors (i.e.: Census, Medicare and multiple movers data were smoothed);
- capping applied to expansion factors;
- expansion factors applied to males aged 19 to 32 years and females aged 19 to 25 years (this differs to the age range used in the 2006–11 method); and
- no smoothing applied to the expansion factors.

24 The previously modelled data for the period September 2006 to June 2011 has been finalised based on data from the 2011 Census. All data from September 2011 onwards is modelled on 2011 Census expansion factors.

EXPLANATORY NOTES *continued*

Net interstate migration
continued

25 For more detailed information on the changes to the model see *Information Paper: Review of Interstate Migration Method, March 2014* (cat. no. 3412.0.55.003).

26 Due to the fact that the Medicare data source is an indirect measure of interstate migration, the post-censal quarterly estimates of interstate migration have long been considered the weakest measure of the components of population change at the state and territory level. For further information on the process of estimating interstate migration and the administrative data used, see:

- *Information Paper: Review of Interstate Migration Method, March 2014* (cat. no. 3412.0.55.003); and
- *Information Paper: Evaluation of Administrative Data Sources for Use in Quarterly Estimation of Interstate Migration, 2006 to 2011* (cat. no. 3127.0.55.001).

Defence force adjustment

27 Medicare theoretically covers all Australian usual residents as well as those non-Australian residents granted temporary Medicare registration. However, there are a range of Australian usual residents who do not access the Medicare system, primarily due to access to alternative health services. One group is the military. As such, estimates of interstate migration produced from the interstate migration model described in the *Information Paper: Review of Interstate Migration Method, March 2014* (cat. no. 3412.0.55.003) are adjusted to compensate for defence force movements not covered by Medicare. These adjustments are estimated using counts of defence force personnel by age, sex and state/territory, obtained from the Department of Defence, with 70% of any change in quarterly defence numbers assumed to be due to interstate migration not otherwise covered by the model.

Final Intercensal Difference

28 The final intercensal difference for the most recent intercensal period 2006–2011, as well as the recast final intercensal difference for the three preceding intercensal periods: 1991–1996, 1996–2001 and 2001–2006 are indicated in the table below.

RECAST FINAL INTERCENSAL DIFFERENCE FOR THE CENSUS PERIODS 1991–2006 AND REBASED FINAL INTERCENSAL DIFFERENCE FOR THE 2006–2011 CENSUS PERIOD

	RECAST FINAL INTERCENSAL DIFFERENCE						REBASED FINAL INTERCENSAL DIFFERENCE	
	1991-1996		1996-2001		2001-2006		2006-2011	
	'000	%	'000	%	'000	%	'000	%

— nil or rounded to zero (including null cells)

(a) Includes Other Territories. The 1991–1996 period is affected by the change to the treatment of Other Territories in relation to ERP in 1993. See Explanatory Note 2.

ESTIMATES AND PROJECTIONS OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION

29 The standard approach to population estimation is not possible for determining the population of Aboriginal and Torres Strait Islander Australian. There are two primary reasons for this: the significant volatility in Aboriginal and Torres Strait Islander Census counts between censuses which cannot be attributed to demographic factors (i.e. the difference cannot be fully accounted for by natural increase and migration over the intercensal period); and the quality of data on births, deaths and migration specific to

EXPLANATORY NOTES *continued*

Aboriginal and Torres Strait Islander people. As a result, a method based on the use of life tables and rates of net interstate migration derived from the Census is used to backcast the series. Aboriginal and Torres Strait Islander estimates, based on the 2011 Census for the period 1996 to 2011, and projections from 2012 to 2026 are available in *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026* (cat. no. 3238.0). Three main projection series were produced with assumptions as follows. Projection Series A assumes: constant fertility rates; 2% annual increase in paternity rates (where the father of a child is Aboriginal or Torres Strait Islander but the mother is not); life expectancy at birth increasing by 0.5 years per year for males and 0.45 years per year for females, reaching 76.5 years for males and 80.4 years for females by 2026; levels of interstate migration as observed in the 2011 Census; and zero net overseas migration. Projection Series B assumes: an annual decrease of 0.5% in fertility rates; 1% annual increase in paternity rates; life expectancy at birth increasing by 0.3 years per year for males and 0.25 years per year for females, reaching 73.5 years for males and 77.4 years for females by 2026; levels of interstate migration as observed in the 2011 Census; and zero net overseas migration. Projection Series C assumes: an annual decrease of 1.0% in fertility rates; constant paternity rates; life expectancy at birth increasing by 0.2 years per year for males and 0.15 years per year for females, reaching 72.0 years for males and 75.9 years for females by 2026; levels of interstate migration as observed in the 2011 Census; and zero net overseas migration.

METHOD FOR DEFINING RESIDENTS TEMPORARILY OVERSEAS

30 The ABS has improved the measure of net overseas migration by expanding the Australian residence criteria from a 12/12 months rule to a 12/16 months rule. This has implications for the measurement of residents temporarily overseas (RTOs) due to the change in residence criteria mentioned above. A final measure of RTOs can only be obtained 21 months after Census night, when actual traveller behaviour, and each traveller's true residence status on Census night (according to 12/16 month rule) can be observed. For further information on the improved measure of net overseas migration see:

- *Information Paper: Improved Methods for Estimating Net Overseas Migration, 2006* (cat. no. 3107.0.55.003); and
- *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia, 2007* (cat. no. 3107.0.55.005).

POPULATION PROJECTIONS

31 Population projections presented in this publication are not predictions or forecasts. They are an assessment of what would happen to Australia's population if the assumed levels of components of population change – births, deaths and migration – were to hold for the next 50–100 years.

32 The ERP at June 2012 based to the 2011 Census is the base for the projections series. Projections off the 2011 Census based ERP were released on 26 November 2013 in "Population Projections, Australia, 2012 (base) to 2101" (cat. no. 3222.0). The three series presented in this publication, and their assumptions are as follows:

33 Series A – assumes the Total Fertility Rate (TFR) will reach 2.0 babies per woman by 2026 and then remain constant, life expectancy at birth will experience continued improvement with increases from 2009–11 levels of 0.25 and 0.19 years each year for males and females respectively until 2060–61 (reaching 92.1 years for males and 93.6 years for females), NOM will increase to 280,000 people per year by 2020–21 and remain constant thereafter, and relatively large net interstate migration gains for some states and territories, corresponding to relatively large losses for other states and territories.

34 Series B – assumes the TFR will decline to 1.8 babies per woman by 2026 and then remain constant, life expectancy at birth will experience declining improvement with increases from 2009–11 levels of 0.25 and 0.19 years each year for males and females respectively until 2015–16 after which life expectancy will continue to increase at

EXPLANATORY NOTES *continued*

POPULATION PROJECTIONS

continued

declining rates (reaching 85.2 years for males and 88.3 years for females by 2060–61), NOM will increase to 240,000 people per year by 2020–21 and remain constant thereafter, and medium net interstate migration gains for some states and territories, and medium losses for others.

35 Series C – assumes the TFR will decline to 1.6 babies per woman by 2026 and then remain constant, life expectancy at birth will experience declining improvement with increases from 2009–11 levels of 0.25 and 0.19 years each year for males and females respectively until 2015–16 after which life expectancy will continue to increase at declining rates (reaching 85.2 years for males and 88.3 years for females by 2060–61), NOM will increase to 200,000 people per year by 2020–21 and then remain constant thereafter, and relatively small net interstate migration gains for some states and territories and small losses for others.

36 For additional series and information (e.g. age, sex, states/territories and greater capital cities/balances of state), see Population Projections, Australia, 2012 (base) to 2101 (cat. no. 3222.0).

HOUSEHOLD PROJECTIONS

37 The ABS uses a propensity method to project numbers of households, families and persons in different living arrangements. The method identifies propensities (proportions) from the Census of Population and Housing for people to belong to different living arrangement types. Trends observed in the propensities over the last four censuses are assumed to continue into the future, and applied to a projected population (see Series B, *Population Projections, Australia, 2006 to 2101* (cat. no. 3222.0)). Numbers of households and families are then derived from the projected living arrangements of the population.

38 Data presented in table 18 are not intended as predictions or forecasts, but are illustrations of growth and change in the numbers of households which would occur if the assumptions about future trends in living arrangements were to prevail over the projection period. For more information see *Household and Family Projections, Australia, 2006 to 2031* (cat. no. 3236.0). Household projections presented in this publication are based on the 2006 Census. Projections based on the 2011 Census are scheduled for release in late 2014.

CONFIDENTIALITY

39 The *Census and Statistics Act, 1905* provides the authority for the ABS to collect statistical information, and requires that statistical output shall not be published or disseminated in a manner that is likely to enable the identification of a particular person or organisation. This requirement means that the ABS must take care and make assurances that any statistical information about individual respondents cannot be derived from published data.

40 Some techniques used to guard against identification or disclosure of confidential information in statistical tables are suppression of sensitive cells, and random adjustments to cells with very small values. To protect confidentiality within this publication, some cell values may have been suppressed and are not available for publication (np) but included in totals where applicable. In these cases, data may not sum to totals due to the confidentialisation of individual cells.

ROUNDING

41 In this publication, population estimates and their components have sometimes been rounded. Rounded figures and unrounded figures should not be assumed to be accurate to the last digit shown. Where figures have been rounded, discrepancies may occur between sums of component items and totals.

EXPLANATORY NOTES *continued*

ACKNOWLEDGMENT

42 ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated: without it, the wide range of statistics published in the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the *Census and Statistics Act 1905*.

USE OF POPULATION ESTIMATES IN AGREEMENTS

43 The ABS is the central statistical authority for the Australian government. It is required by law to publish official population estimates. It abides by codes of professional practice that include being open and transparent about underlying methodology. The ABS provides regular explanatory information to support users in understanding both population trends and methodological changes, but does not comment on the specific use (or otherwise) of official population estimates by other organisations or individuals.

44 Population estimates are used extensively within the Australian community, including in a range of agreements. Although the ABS acknowledges that the official population estimates and changes in these estimates are specifically referenced in various agreements, it neither endorses nor disapproves of the terms of the agreements and decisions made by parties in relation to those agreements. In addition, the ABS does not provide a position on disputes arising from the interpretation of terms of an agreement that reference official population estimates.

GLOSSARY

12/12 month rule	A method for measuring an overseas traveller's duration of stay or absence in which the 12 month usual residence criterion in population estimates is measured across a 12 month period. Under a 12/12 month rule, overseas travellers must be resident in Australia for a continuous 12 month period or more to be included in the estimated resident population. Similarly, Australian residents travelling overseas must be absent from Australia for a continuous 12 month period or more to be removed from the estimated resident population.
12/16 month rule	<p>A method for measuring an overseas traveller's duration of stay or absence which takes an approach to measure usual residence that <i>does not have to be continuous</i>, as opposed to the <i>continuous</i> approach used under a '12/12 month rule'. Under a '12/16 month rule', incoming overseas travellers (who <i>are not</i> currently counted in the population) must be resident in Australia for a total period of 12 months or more, during the 16 month follow-up period to then be included in the estimated resident population. Similarly, those travellers departing Australia (who <i>are</i> currently counted in the population) must be absent from Australia for a total of 12 months or more during the 16 month follow-up period to then be subtracted from the estimated resident population.</p> <p>The 12/16 month rule therefore takes account of those persons who may have left Australia briefly and returned, while still being resident for 12 months out of 16. Similarly, it takes account of Australians who live most of the time overseas but periodically return to Australia for short periods.</p>
Age-specific fertility rates	Age-specific fertility rates in this publication are the number of live births (occurred or registered) during the financial year, according to age of mother, per 1,000 of the female estimated resident population of the same age at 31 December. For calculating these rates, births to mothers under 15 years are included in the 15–19 years age group, and births to mothers aged 50 years and over are included in the 45–49 years age group. Pro rata adjustment is made for births for which age of mother is not given.
Average annual rate of growth	<p>The average annual growth rate, r, is calculated as a percentage using the formula:</p> $r = \left[\left(\frac{P_n}{P_0} \right)^{\frac{1}{n}} - 1 \right] \times 100$ <p>where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_0 and P_n in years.</p>
Birth	The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as heartbeat.
Capital City	Refers to the Greater Capital City Statistical Areas of states and territories as defined in <i>Australian Statistical Geography Standard (ASGS): Volume 1 – Main Structure and Greater Capital City Statistical Areas, July 2011</i> (cat. no. 1270.0.55.001).
Census	The complete enumeration of a population at a point in time with respect to well-defined characteristics (e.g. Persons, Manufacturing, etc.). When the word is capitalised, "Census" usually refers to the national Census of Population and Housing.
Death	<p>Death is the permanent disappearance of all evidence of life after birth has taken place. The definition excludes deaths prior to live birth.</p> <p>For the purposes of the Deaths and Causes of Death collections conducted by the ABS, a death refers to any death which occurs in, or en route to Australia and is registered with a state or territory Registry of Births, Deaths and Marriages.</p>
Estimated resident population (ERP)	The official measure of the population of Australia is based on the concept of usual residence. It refers to all people, regardless of nationality, citizenship or legal status, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months over a 16 month period. It excludes overseas visitors who are in Australia for less than 12 months over a 16 month period.

GLOSSARY *continued*

- Estimated resident population (ERP) *continued*** Estimates of the Australian resident population are generated on a quarterly basis by adding natural increase (the excess of births over deaths) and net overseas migration (NOM) occurring during the period to the population at the beginning of each period. This is known as the cohort component method, and can be represented by the following equation:
- $$P_{t+1} = P_t + B - D + \text{NOM}, \text{ where:}$$
- P_t = the estimated resident population at time point t
 P_{t+1} = the estimated resident population at time point $t+1$
 B = the number of births occurring between t and $t+1$
 D = the number of deaths occurring between t and $t+1$
 NOM = net overseas migration occurring between t and $t+1$.
- For state and territory population estimates, an additional term is added to the equation representing net interstate migration (NIM) occurring between t and $t+1$, represented by the following equation:
- $$P_{t+1} = P_t + B - D + \text{NOM} + \text{NIM}.$$
- Final intercensal difference (previously referenced as Intercensal discrepancy)** Final intercensal difference is the final difference between two estimates at 30 June of a Census year population: the first based on the latest Census, and the second arrived at by updating the 30 June estimate of the previous Census year with intercensal components of population change. It is caused by differences in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source. For further information see *Population Estimates: Concepts, Sources and Methods, 2009* (cat. no. 3228.0.55.001).
- As previously advised, the ABS will replace the terms *Intercensal error* and *Intercensal discrepancy* with the terms *Preliminary Intercensal difference* and *Final intercensal difference* respectively in the 2016 rebasing cycle. This is being done in response to the term 'intercensal error' often being misinterpreted, with the word 'error' being too commonly considered to be a synonym for 'mistake'. See Glossary term 'Preliminary intercensal difference' for additional information.
- Greater Capital City Statistical Area (GCCSA)** Represent the socioeconomic area of each of the eight state and territory capital cities. These boundaries are built from aggregations of whole Statistical Areas Level 4. GCCSA boundaries represent a broad socioeconomic definition of each capital city, they contain not only the urban area of the capital city, but also surrounding and non-urban areas where much of the population has strong links to the capital city, through for example, commuting to work.
- Household** A household is a group of two or more related or unrelated people who usually reside in the same dwelling who regard themselves as a household and who make common provision for food or other essentials for living; or a person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person. Households include group households of unrelated persons, same-sex couple households, single-parent households as well as one-person households.
- A household usually resides in a private dwelling (including caravans etc. in caravan parks). Persons usually resident in non-private dwellings, such as hotels, motels, boarding houses, gaols and hospitals, are not included in household estimates.
- This definition of a household is consistent with the definition used in the Census.
- Household population** The household population is the estimated resident population (ERP) that usually lives in private dwellings. It is the ERP less the population that usually lives in non-private dwellings.
- Infant death** An infant death is the death of a live-born child who dies before reaching his/her first birthday.

GLOSSARY *continued*

Infant mortality rate (IMR)	The number of deaths of children under one year of age in a financial year per 1,000 live births in the same financial year.
Median age	For any distribution, the median value is that which divides the relevant population into two equal parts, half falling below the value, and half exceeding it. Thus, the median age is the age at which half the population is older and half is younger.
Migration adjustment	Prior to September quarter 2006, the ABS applied a number of adjustments to overseas arrivals and departures data in order to produce estimates of net overseas migration (NOM). These mainly comprised adjustments designed to reflect differences between stated travel intentions and actual travel behaviour. Until recently, adjustments used by ABS to produce NOM estimates were collectively referred to as 'category jumping adjustments'. They are now referred to more simply as 'migration adjustments'.
Natural increase	Excess of births over deaths.
Net interstate migration	The difference between the number of persons who have changed their place of usual residence by moving into a given state or territory and the number who have changed their place of usual residence by moving out of that state or territory during a specified time period. This difference can be either positive or negative.
Net overseas migration (NOM)	<p>Net overseas migration is the net gain or loss of population through immigration to Australia and emigration from Australia. Under the current method for estimating final net overseas migration this term is based on a traveller's <i>actual</i> duration of stay or absence using the '12/16 month rule'. Preliminary NOM estimates are modelled on patterns of traveller behaviours observed in final NOM estimates for the same period one year earlier. NOM is:</p> <ul style="list-style-type: none">■ based on an international traveller's duration of stay being in or out of Australia for 12 months or more over a 16 month period;■ the difference between:<ul style="list-style-type: none">■ the number of incoming international travellers who stay in Australia for 12 months or more over a 16 month period, who <i>are not</i> currently counted within the population, and are then added to the population (NOM arrivals); and■ the number of outgoing international travellers (Australian residents and long-term visitors to Australia) who leave Australia for 12 months or more over a 16 month period, who <i>are</i> currently counted within the population, and are then subtracted from the population (NOM departures).
NOM arrivals	<p>NOM arrivals are all overseas arrivals that contribute to net overseas migration (NOM). It is the number of incoming international travellers who stay in Australia for 12 months or more over a 16 month period, who <i>are not</i> currently counted within the population, and are then added to the population.</p> <p>Under the current method for estimating final net overseas migration this term is based on a traveller's <i>actual</i> duration of stay or absence using the '12/16 month rule'.</p>
NOM departures	<p>NOM departures are all overseas departures that contribute to net overseas migration (NOM). It is the number of outgoing international travellers (Australian residents and long term visitors to Australia) who leave Australia for 12 months or more over a 16 month period, who <i>are</i> currently counted within the population, and are then subtracted from the population.</p> <p>Under the current method for estimating final net overseas migration this term is based on a traveller's <i>actual</i> duration of stay or absence using the '12/16 month rule'.</p>
Net undercount	The difference between the actual Census count (including imputations) and an estimate of the number of people who should have been counted in the Census. This estimate is based on the Post Enumeration Survey (PES) conducted after each Census. For a category of person (e.g. based on age, sex and state of usual residence), net undercount is the result of Census undercount, overcount, misclassification and imputation error.

GLOSSARY *continued*

Population growth	For Australia, population growth is the sum of natural increase and net overseas migration. For states and territories, population growth also includes net interstate migration. After the Census, intercensal population growth also includes an allowance for intercensal discrepancy.
Population growth rate	Population change over a period as a proportion (percentage) of the population at the beginning of the period.
Population projections	The ABS uses the cohort-component method for producing population projections of Australia, the states, territories, capital cities and balances of state. This method begins with a base population for each sex by single year of age and advances it year by year, for each year in the projection period, by applying assumptions regarding future fertility, mortality and migration. The assumptions are based on demographic trends over the past decade and longer, both in Australia and internationally. The projections are not predictions or forecasts, but are simply illustrations of the change in population which would occur if the assumptions were to prevail over the projection period. A number of projections are produced by the ABS to show a range of possible future outcomes.
Post enumeration survey (PES)	The Census Post Enumeration Survey (PES) is a household survey conducted three to four weeks after the Census. The PES allows the ABS to estimate the number of people missed in the Census and the number counted more than once. Usually more people are missed than are counted more than once in Australia, leading to a net undercount. Results from the PES contribute to a more accurate calculation of the estimated resident population (ERP) for Australia and the states and territories, which is then backdated to 30 June of the Census year.
Preliminary intercensal difference (previously referenced as Intercensal error)	<p>Preliminary Intercensal difference is the preliminary difference between two estimates at 30 June of a Census year population: the first based on the latest Census and the second arrived at by updating the 30 June estimate of the previous Census year with intercensal components of population change. For further information see <i>Population Estimates: Concepts, Sources and Methods, 2009</i> (cat. no. 3228.0.55.001).</p> <p>As previously advised, the ABS will replace the terms <i>Intercensal error</i> and <i>Intercensal discrepancy</i> with the terms <i>Preliminary Intercensal difference</i> and <i>Final intercensal difference</i> respectively in the 2016 rebasing cycle. This is being done in response to the term 'intercensal error' often being misinterpreted, with the word 'error' being too commonly considered to be a synonym for 'mistake'. See Glossary term 'Final intercensal difference' for additional information.</p>
Sex ratio	The sex ratio relates to the number of males per 100 females. The sex ratio is defined for the total population, at birth, at death and among age groups by appropriately selecting the numerator and the denominator of the ratio.
Significant Urban Area (SUA)	Aggregations of whole Statistical Areas Level 2 to define and contain major urban and near-urban concentrations of over 10,000 people. They include the urban population, any immediately associated populations, and may incorporate together one or more closely associated Urban Centre and Localities and the areas between. They are designed to incorporate any likely growth over the next 20 years. SUAs do not cover the whole of Australia, and may cross State boundaries.
Standardised death rate (SDR)	<p>Standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current standard population is all persons in the Australian population at 30 June 2001 (19,413,240), as published prior to recasting the ERP series. SDRs are expressed per 1,000 or 100,000 persons. There are two methods of calculating SDRs:</p> <ul style="list-style-type: none">■ The <i>direct method</i> – this is used when the populations under study are large and the age-specific death rates are reliable. It is the overall death rate that would have prevailed in the standard population if it had experienced at each age the death rates of the population under study; and

GLOSSARY *continued*

Standardised death rate (SDR) <i>continued</i>	<ul style="list-style-type: none">■ The <i>indirect method</i> – this is used when the populations under study are small and the age-specific death rates are unreliable or not known. It is an adjustment to the crude death rate of the standard population to account for the variation between the actual number of deaths in the population under study and the number of deaths which would have occurred if the population under study had experienced the age-specific death rates of the standard population.
State or territory of usual residence	<p>State or territory of usual residence refers to the state or territory of usual residence of:</p> <ul style="list-style-type: none">■ the population (estimated resident population);■ the mother (birth collection); and■ the deceased (death collection). <p>In the case of overseas movements, state or territory of usual residence refers to the state or territory regarded by the traveller as the one in which he/she lives or has lived. State or territory of intended residence is derived from the intended address given by settlers, and by Australian residents returning after a journey abroad. Particularly in the case of the former, this information does not necessarily relate to the state or territory in which the traveller will eventually establish a permanent residence.</p>
Statistical Area Level 1 (SA1)	<p>An area defined in the Australian Statistical Geography Standard designed as the smallest unit for the release of Census data. They generally have a population of 200 to 800 people, and an average population of about 400 people. SA1s in remote and regional areas generally have smaller populations than those in urban areas. SA1s aggregate to all Non-ABS ASGS Structures except Local Government Areas and Tourism Regions. There are approximately 55,000 SA1s and they cover the whole of Australia without gaps or overlaps. Population estimates are prepared for SA1s by disaggregating SA2 level estimates.</p>
Statistical Area Level 2 (SA2)	<p>A general-purpose medium-sized area defined in the Australian Statistical Geography Standard built from whole SA1s. Their aim is to represent a community that interacts together socially and economically. SA2s are based on officially gazetted suburbs and localities. In urban areas, SA2s largely conform to one or more whole suburbs, while in rural areas they generally define the functional zone of a regional centre. SA2s generally have a population range of 3,000 to 25,000 people, and an average population of about 10,000 people. There are approximately 2,200 SA2s and they cover the whole of Australia without gaps or overlaps. SA2s are the base unit for preparing sub-state population estimates.</p>
Statistical Area Level 3 (SA3)	<p>An area defined in the Australian Statistical Geography Standard built up from SA2s to provide a standardised regional breakup of Australia. SA3s aim to create a standard framework for the analysis of ABS data at the regional level through clustering groups of whole SA2s that have similar regional characteristics. Their boundaries reflect a combination of widely recognised informal regions as well as existing administrative regions such as State Government Regions in rural areas and Local Government Areas in urban areas. SA3s generally range in population from 30,000 to 130,000 people. There are around 330 SA3s and they cover the whole of Australia without gaps or overlaps.</p>
Statistical Area Level 4 (SA4)	<p>An area defined in the Australian Statistical Geography Standard designed for the output of labour force data and to reflect labour markets. In rural areas SA4s generally represent aggregations of multiple small labour markets with socioeconomic connections or similar industry characteristics. Large regional city labour markets are generally defined by a single SA4. Within major metropolitan labour markets SA4s represent sub-labour markets. SA4s are built from whole SA3s. They generally have a population over 100,000 people to enable accurate labour force survey data to be generated. There are 88 SA4s and they cover the whole of Australia without gaps or overlaps.</p>

GLOSSARY *continued*

Total fertility rate (TFR)	The sum of age-specific fertility rates (live births at each age of mother per female population of that age) divided by 1,000. It represents the number of children a female would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life (ages 15 – 49).
Under enumeration	See Net undercount.
