KEY FIGURES

PRELIMINARY DATA

	Population at end Mar qtr 2009 '000	Change over previous year '000	Change over previous year %
New South Wales	7 076.5	112.5	1.6
Victoria	5 402.6	111.9	2.1
Queensland	4 380.4	112.7	2.6
South Australia	1 618.2	18.6	1.2
Western Australia	2 224.3	67.6	3.1
Tasmania	501.8	5.0	1.0
Northern Territory	223.1	4.8	2.2
Australian Capital Territory	349.9	6.0	1.8
Australia(a)	21 779.1	439.1	2.1

(a) Includes Other Territories comprising Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.

KEY POINTS

ESTIMATED RESIDENT POPULATION

- The preliminary estimated resident population (ERP) of Australia at 31 March 2009 was 21,779,000 persons. This was an increase of 439,100 persons (2.1%) since 31 March 2008 and 135,100 persons since 31 December 2008.
- Preliminary natural increase recorded for the year ended 31 March 2009 (160,800) was 15.2% (or 21,200 persons) higher than the natural increase recorded for the year ended 31 March 2008 (139,700).
- Preliminary net overseas migration for the year ended 31 March 2009 was 278,200 persons.

POPULATION GROWTH RATES

- Australia's population grew by 2.1% during the 12 months ended 31 March 2009. Natural increase and net overseas migration contributed 37% and 63% respectively to this total population growth.
- All states and territories experienced positive population growth over the 12 months ended 31 March 2009. Western Australia recorded the largest percentage gain (3.1%) and Tasmania the smallest (1.0%).

NOTES

FORTHCOMING ISSUES	ISSUE (Quarter)	RELEASE DATE

	December 2010	9 December 2010
	September 2010	23 March 2011

CHANGES IN THIS ISSUE

Table 10, Experimental estimated and projected resident Indigenous population, has been updated following the release of *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2021* (cat. no. 3238.0)

Due to the small number of infant deaths in most quarters in the Northern Territory and the Australian Capital Territory, quarterly estimates are not available for publication but are included in financial and calendar year totals. See Table 15.

ERP STATUS

Data for 30 September 2001 to 30 June 2006 are final and based on the 2006 Census of Population and Housing. Data for the 2006-07 financial year are revised and data from 30 September 2007 onwards are preliminary. For further information refer to paragraph 7 of the Explanatory Notes.

Due to the collection and estimation methods applied to produce preliminary statistics, users should exercise caution when analysing and interpreting the most recent annual and quarterly estimates for all components of the estimated resident population, particularly when making time series comparisons.

CONCEPTS SOURCES AND METHODS

The ABS released *Population Estimates: Concepts Sources and Methods, 2009* (cat. no. 3228.0.55.001) on 12 June 2009. This publication provides a description of the concepts, sources and methods used by the ABS in the production of population estimates.

NET OVERSEAS MIGRATION

Experience in using the new NOM methodology, as well as the subsequent availability of new information, has indicated that it may be possible to make further improvements to the preliminary estimates. The ABS is investigating this and will consult with major users in the later part of 2009 regarding improvements to the methodology.

UPCOMING RELEASES

Births, Australia, 2008 (cat. no. 3301.0) will be released on 11 November 2009.

Deaths, Australia, 2008 (cat. no. 3302.0) will be released on 25 November 2009.

Brian Pink
Australian Statistician

MAIN FEATURES

POPULATION AND GROWTH

The preliminary estimated resident population (ERP) of Australia at 31 March 2009 was 21,779,000 persons, an increase of 439,100 since 31 March 2008 and 135,100 persons since 31 December 2008. The increase for the year ended 31 March 2009 is the largest recorded for a 12 month period since the quarterly ERP time series began in 1981 (see paragraphs 4 to 6 of the Explanatory Notes for more detail on ERP).

The annual population growth rate for the year ended 31 March 2009, at 2.06% was the fastest annual growth rate for a year ended 31 March since quarterly ERP data started in June 1981.

COMPONENTS OF POPULATION CHANGE

Natural Increase

Natural increase for the 12 months ended 31 March 2009 was 160,800 persons, an increase of 15.2% (or 21,200 persons) on the natural increase for the year ended 31 March 2008 (139,700 persons).

BIRTHS

The preliminary estimate for births during the year ended 31 March 2009 (304,500) was 8.2% higher than the figure for the year ended 31 March 2008 (281,500).

DEATHS

The preliminary estimate for deaths during the year ended 31 March 2009 (143,700) was the highest ever recorded for a year ending 31 March.

Net Overseas Migration

For the year ended 31 March 2009, Australia's preliminary net overseas migration (NOM) estimate was 278,200 persons. This was the difference between 502,800 overseas arrivals that were added to the population (NOM arrivals) and 224,600 overseas departures that were subtracted from the population (NOM departures). The contribution made to population growth by NOM (63.4%) was higher than that of natural increase (36.6%).

STATES AND TERRITORIES: POPULATION AND GROWTH

The estimated resident populations for the states and territories at 31 March 2009 were as follows: New South Wales 7,076,000, Victoria 5,403,000, Queensland 4,380,000, South Australia 1,618,000, Western Australia 2,224,000, Tasmania 501,800, the Northern Territory 223,100 and the Australian Capital Territory 349,900.

All states and territories recorded positive population growth over the 12 months ended 31 March 2009. Western Australia recorded the fastest growth rate (3.1%), followed by Queensland (2.6%), the Northern Territory (2.2%), Victoria (2.1%), the Australian Capital Territory (1.8%), New South Wales (1.6%), South Australia (1.2%) and Tasmania (1.0%).

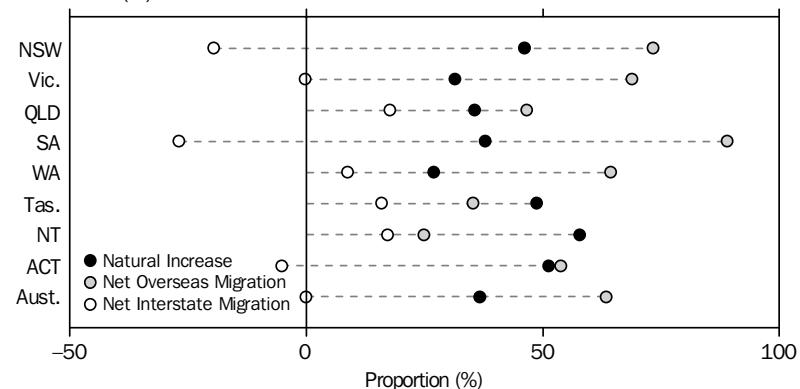

MAIN FEATURES *continued*

COMPONENTS OF POPULATION CHANGE

At the state and territory level, population growth has three components: natural increase, net overseas migration and net interstate migration.

Although all states and territories experienced positive population growth in the year ended 31 March 2009, the proportion that each of these components contributed to population growth varied between the states and territories.

POPULATION COMPONENTS AS A PROPORTION OF TOTAL GROWTH(a)—Year ended 31 March 2009

(a) Each population component as a proportion of a state's or territory's population growth for year ended 31 March 2009.

Natural Increase

As illustrated in the graph above, natural increase was the major component of population growth in the Northern Territory at 57.9% (2,800 persons) and Tasmania at 48.6% (2,400 persons) for the year ended 31 March 2009.

BIRTHS

The number of births registered for the 12 months ended 31 March 2009 increased in comparison with the previous year, in most states and territories. New South Wales recorded the largest percentage increase of 17.3%, followed by Queensland (14.5%).

DEATHS

The number of deaths registered for the 12 months ended 31 March 2009 increased in comparison with the previous year, in most states and territories. The Australian Capital Territory recorded the largest percentage increase of 5.9%, followed by South Australia (4.0%).

Net Overseas Migration

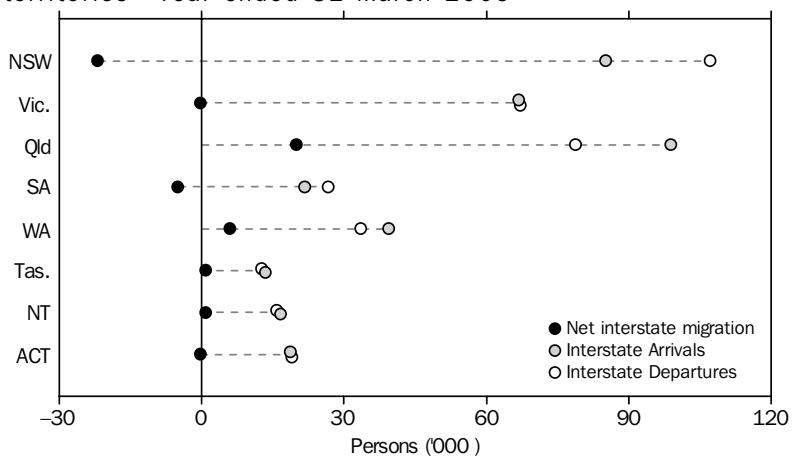

The contribution of NOM, as illustrated in the above graph, was the major component of population growth in South Australia at 88.9% (16,500 persons) for the year ended 31 March 2009, followed by New South Wales at 73.3% (82,500 persons). This was followed by Victoria at 68.8% (77,000 persons), Western Australia at 64.3% (43,400 persons), the Australian Capital Territory at 53.9% (3,300 persons) and Queensland at 46.7% (52,600). Tasmania and the Northern Territory also experienced positive net overseas migration.

MAIN FEATURES *continued*

Net Interstate Migration

For the year ended 31 March 2009, Queensland experienced the highest positive net interstate migration with a gain of 20,000 persons. Other states and territories that experienced positive net interstate migration were Western Australia (5,900 persons), the Northern Territory (830 persons) and Tasmania (800). Negative net interstate migration was experienced by New South Wales (-21,900 persons), South Australia (-5,000 persons), the Australian Capital Territory (-310 persons) and Victoria (-300 persons).

INTERSTATE MIGRATION, Arrivals, Departures and Net—States and territories—Year ended 31 March 2009

- (a) Includes Other Territories – see paragraph 2 of the Explanatory Notes for concepts used, and the glossary for definitions used.
- (b) For further information on each component of population change refer to the Explanatory Notes.
- (c) These NOM estimates contain a break in series. Estimates for September quarter 2006 onwards use an improved methodology and are not comparable with NOM estimates from earlier periods – see paragraphs 12–15 of the Explanatory Notes.
- (d) Differences between total growth and the sum of the components of population change prior to September quarter 2006 are due to intercensal discrepancy.
- (e) Estimates for all components of population change for September quarter 2007 onwards are preliminary.

.. not applicable

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) Estimates of net interstate migration for September quarter 2007 onwards are preliminary. For further information see paragraphs 16–20 of the Explanatory Notes.

(c) Differences between total growth and the sum of the components of population change prior to September quarter 2006 are due to intercensal discrepancy.

(d) Estimates of total population growth for September quarter 2007 onwards are preliminary – see Status of quarterly ERP data at paragraph 7 of the Explanatory Notes.

- (a) Total population growth rate broken down into its three components.
 (b) Includes Other Territories – see paragraph 2 of the Explanatory notes.
 (c) Natural increase estimates for September quarter 2007 onwards are preliminary on a quarter of registration basis. See paragraphs 8–11 of the Explanatory Notes.

- (d) These NOM estimates contain a break in series. Estimates for September quarter 2006 onwards use an improved methodology and are not comparable with NOM estimates from earlier periods – see paragraphs 12–15 of the Explanatory Notes.
 (e) Estimates of NOM for September quarter 2007 onwards are preliminary.

(a) Estimates are based on the 2008 Australian Standard Geographical Classification (ASGC) boundaries.

(b) Based on data published in *Regional Population Growth, Australia, 2007–08* (cat. no. 3218.0).

(c) Estimates for major population regions at 30 June 2003 are final and based on the 2006 Census.

(d) Estimates for major population regions at 30 June 2007 have been revised.

(e) Estimates for major population regions at 30 June 2008 are preliminary.

(a) Proportion of the population of total Australia.

(b) Estimated resident population at 31 March 2009 is preliminary.

(c) Population numbers for the Australian External Territories are updated once a year and do not have a revision process applied. See paragraph 3 of the Explanatory Notes.

(d) Includes only the population administered by Australian Antarctic Territory.

(a) Uses preliminary ERP at 30 June 2007 as the base population. See *Population Projections, Australia, 2006–2101* (cat. no. 3222.0).

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Series A assumes high levels of fertility, life expectancy, overseas migration and interstate migration flows.

(d) Series B assumes medium levels of fertility, life expectancy, overseas migration and interstate migration flows.

(e) Series C assumes low levels of fertility, life expectancy, overseas migration and interstate migration flows.

At 30 June	New South Wales	Victoria	Queensland	South Australia	Western Australia	Tasmania	Northern Territory	Australian Capital Territory	Australia(c)

(a) Data are based on the 2006 Census.

(b) For information on these experimental estimates and projections see paragraph 22 of the Explanatory Notes.

(c) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(d) Series A assumes declining fertility, increasing paternity, constant net interstate migration, zero net overseas migration and constant life expectancy at birth.

(e) Series B assumes declining fertility, increasing paternity, constant net interstate migration, zero net overseas migration and increasing life expectancy at birth.

- (a) See paragraphs 8–11 of the Explanatory Notes for more information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data.
- (b) Preliminary birth estimates are calculated using birth registration date. As a result, estimates can fluctuate from quarter to quarter due to delays and subsequent recovery in processing. This is particularly evident in Qld and NSW estimates. After the estimates are revised they are based on quarter of occurrence and are no longer affected by processing times. For more information see paragraphs 8–11 of the Explanatory Notes.
- (c) Includes Other Territories – see paragraph 2 of the Explanatory Notes.
- (d) Birth estimates for September quarter 2007 onwards are preliminary on a quarter of registration basis.
- (e) Births per woman.
- (f) Calculated using revised births on occurrence basis and final ERP based on the 2006 Census unless otherwise stated.
- (g) Calculated using revised births on occurrence basis and revised ERP based on the 2006 Census.
- (h) Calculated using preliminary births on registration basis and preliminary ERP based on the 2006 Census.

np not available for publication but included in totals where applicable, unless otherwise indicated

(a) See paragraphs 8–11 of the Explanatory Notes for information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data.

(b) Due to the small number of infant deaths in most quarters in the Northern Territory and the Australian Capital Territory, quarterly estimates are not available for publication but are included in financial and calendar year totals.

(c) Includes Other Territories – see paragraph 2 of the Explanatory notes.

(d) Infant death estimates for September quarter 2007 onwards are preliminary on a quarter of registration basis.

(e) Per 1,000 live births.

(f) Calculated using revised infant deaths and revised births both on occurrence basis unless otherwise stated in this table.

(g) Calculated using preliminary infant deaths and preliminary births both on registration basis.

(a) This time series commences at September 2006. They are compiled using an improved methodology that is not comparable with NOM estimates from earlier periods, as shown in Table 2. For more information see paragraphs 12–15 of the Explanatory Notes.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Arrivals and departures contribute to Net Overseas Migration. For more information see Glossary or *Migration, Australia* (cat. no. 3412.0).

(d) NOM estimates for September quarter 2007 onwards are preliminary.

- (a) This table contains movement data and should not be interpreted as 'persons'. See paragraphs 23–27 of the Explanatory Notes.
- (b) Figures for short-term movements are based on a sample and are subject to sampling error. See *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0) for more detail.
- (c) Due to rounding the total may not equal the sum of categories of the overseas arrivals.
- (d) Stated intention on arrival.

(a) Data are based on the 2001 Census, Series II, *Household and Family Projections, Australia, 2001 to 2026* (cat. no. 3236.0). For further information, see paragraphs 35–37 of the Explanatory Notes.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

EXPLANATORY NOTES

INTRODUCTION

1 This quarterly publication contains the most recent estimates of the resident populations (ERP) of Australia and the states and territories based on the results of the *2006 Census of Population and Housing* held on 8 August 2006 (with various adjustments described in paragraph 5). The ABS has used the 2006 Census to produce final rebased estimates of the resident population (refer to paragraph 6). The publication contains the latest available statistics on births, deaths (including infant deaths) and overseas and interstate migration. In addition, the publication includes estimates of the resident population by age groups, major population regions and experimental estimates and projections of the Aboriginal and Torres Strait Islander population. It also includes projected resident populations and projected number of households. Periodically, articles on specific demographic topics will be released on the ABS web site in conjunction with this publication.

2 Following the 1992 amendments to the *Acts Interpretation Act* to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state and territory level has been created, known as Other Territories. Other Territories include Jervis Bay Territory (previously included with the Australian Capital Territory), as well as Christmas Island and the Cocos (Keeling) Islands which were previously excluded from population estimates for Australia. Data for Other and External Territories are detailed separately in Table 8.

3 Estimates for Australian External Territories will be updated annually as at 30 June unless a more recent estimate is required for electoral apportionment purposes under the *Commonwealth Electoral Act 1918*.

POPULATION AND COMPONENTS OF POPULATION CHANGE

4 Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Information Paper: Population Concepts, 2008* (cat. no. 3107.0.55.006) and also in *Population Estimates: Concepts, Sources and Methods, 2009* (cat. no. 3228.0.55.001).

Method of estimation

5 The estimated resident population is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the component of natural increase (on a usual residence basis) and the component of net overseas migration. For the states and territories, account is also taken of estimated interstate movements involving a change of usual residence. Estimates of the resident population are based on Census counts by place of usual residence, to which are added the estimated Census net undercount and the number of Australian residents estimated to have been temporarily overseas at the time of the Census. Overseas visitors in Australia are excluded from this calculation.

6 After each Census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the estimated resident populations at the two 30 June dates in the respective Census years.

Status of quarterly ERP data

7 The status of quarterly ERP data changes over time from preliminary to revised to final as new component data becomes available. The following table shows the current status of ERP and the components of population change: natural increase, net overseas migration and net interstate migration.

EXPLANATORY NOTES *continued*

STATUS OF QUARTERLY ESTIMATED RESIDENT POPULATION (ERP) DATA—as at 22 September 2009

	Census base	Natural increase	Net overseas migration	Net interstate migration	ERP STATUS
Sep. 1996–Jun. 1997	Final rebased—based on 2001 Census	Final	Final	Final—rebased to 2001 Census	FINAL
Sep. 1997–Jun. 2001	Final rebased—based on 2001 Census	Final	Final—category jumping set to zero	Final—rebased to 2001 Census	FINAL
Sep. 2001–Jun. 2006	Final rebased—based on 2006 Census	Final	Final—includes migration adjustment using matched passenger cards	Final—rebased to 2006 Census	FINAL
Sep. 2006–Jun. 2007	Revised estimate—based on 2006 Census	Revised—based on date of occurrence	Final—improved method of NOM introduced and used for Sep. quarter 2006 onwards. Final NOM estimates are based on actual traveller behaviour.	Revised—modelled—expansion factors based on 2006 Census	REVISED
Sep. 2007–onwards	Preliminary estimate—based on 2006 Census	Preliminary—based on date of registration	Preliminary—NOM estimates are based on international movement data for the reference quarter, adjusted by information derived from travellers with the same characteristics from the corresponding quarter two years earlier.	Preliminary—modelled—expansion factors based on 2006 Census	PRELIMINARY

Natural increase: births and deaths

8 Natural increase is a major component of ABS quarterly state and territory population estimates and is calculated using the estimated number of births and deaths. The births and deaths data in this release are shown by state and territory of usual residence, using year/quarter of registration for preliminary data and year/quarter of occurrence for both revised and final data. This may affect time series comparisons within relevant tables. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates, a factor has been applied to the number of occurrences to allow for those occurrences which were yet to be registered at the time of revision. For final estimates between 30 June 1991 and 30 June 2006, year/quarter of occurrence data are used. For further details see *Demography Working Paper 1998/2 – Quarterly Birth and Death Estimates, 1998* (cat. no. 3114.0).

9 The timeliness and accuracy of ABS quarterly population estimates depends in part on the timeliness and accuracy of estimates of births and deaths which are based on registrations. To be able to provide timely estimates the ABS produces preliminary estimates using births and deaths by quarter of registration as a proxy for quarter of occurrence. The major difficulty in this area stems from the fact that while the vast majority of births and deaths are registered promptly, a small proportion of registrations are delayed for months or even years. Lags or accumulations in births and deaths registrations can be caused by either:

- late notification of a birth or death event to a state or territory registry;
- delays arising from incomplete information supplied for a registration;
- procedural changes affecting the processing cycles in any of the state and territory registries; and
- resolution of issues that may arise within the ABS or registry processing systems.

10 Preliminary births and deaths estimates are subject to fluctuations caused by lags or accumulations in the reporting of births and deaths registrations. Accumulations can result from the eventual processing of lagged registrations in a later quarter. As a result, preliminary quarterly estimates can be an underestimate or an overestimate of the true numbers of births and deaths occurring in a reference period. Note that estimates from September quarter 2007 onwards are preliminary.

11 Selected birth estimates which were higher or lower than usual have been explained by the state registrars as follows:

EXPLANATORY NOTES *continued*

Natural increase: births and deaths continued

- September 2008: New South Wales recorded a higher than usual number of registrations in September quarter 2008 due to additional staff being employed to clear processing backlogs in March and June quarters in 2008.
- June 2008: The number of birth registrations in New South Wales and Queensland for the June quarter 2008 were higher than usual due to the resolution of processing lags.
- March 2008: The processing of birth registrations in New South Wales was delayed in the March quarter 2008 and priority given to death registrations. For more information refer to <http://www.bdm.nsw.gov.au>.
- March 2008: March quarter 2008 birth registrations in Queensland showed a return to historical March figures following changes to processing in 2007. See Explanatory Notes 8–10 for more information.
- December 2007: Under reporting of birth registrations to the Australian Bureau of Statistics for Victoria was identified in December quarter 2007. Additional records from the Victorian Registry of Births, Deaths and Marriages for 2007 were processed and included in estimates of births, natural increase, total population growth and estimated resident population for each quarter of 2007.
- December 2007: The number of birth registrations in Queensland for December quarter 2007 was higher than usual due to changes in procedures for processing birth registrations by the Queensland Registry of Births, Deaths and Marriages.
- September 2007: The number of birth and death registrations in all states and territories for the September quarter 2007 was higher than usual. Amendments to the *A New Tax System (Family Assistance) Act 1999* which took effect from 1 July 2007 requires the registration of, or application for registration of, the birth of a child as a condition for applying for the Baby Bonus (for further information on the Baby Bonus refer to <http://www.fahcsia.gov.au>). In addition to increases in the timeliness and completeness of birth registration applications, strategies have been implemented by some state and territory Registrars of Births, Deaths and Marriages, which have further improved on the timeliness of both birth and death registration processing.

Net overseas migration

12 Conceptually net overseas migration (NOM) is based on an international travellers' duration of stay being in or out of Australia for 12 months or more. It is the difference between the number of incoming travellers who stay in Australia for 12 months or more and are added to the population (NOM arrivals) and the number of outgoing travellers who leave Australia for 12 months or more and are subtracted from the population (NOM departures). For the method based on the 12/16 rule this 12 months does not have to be continuous and is measured over a 16 month reference period. For example whether a traveller is in or out of the population is determined by their exact duration of stay in Australia over the subsequent 16 months after arrival or departure.

13 The ABS has developed improved methods for estimating NOM. This has been used in estimating Australia's official population since September quarter 2006. Estimates of NOM based on the previous methods and those based on the improved methods are not comparable. The key change is the introduction of a '12/16 month rule' for determining a person's residency in Australia, replacing the previous '12/12 month rule'. Estimates of NOM up to June quarter 2006 use the previous methods for estimating NOM (12/12 rule) unless specified as using the improved methodology for earlier periods. For further information on the improved method see:

- *Information Paper: Improved Methods for Estimating Net Overseas Migration, 2006* (cat. no. 3107.0.55.003).
- *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia, 2007* (cat. no 3107.0.55.005).

EXPLANATORY NOTES *continued*

Net overseas migration *continued*

14 Prior to 1 July 2006, NOM estimation methods used a 12/12 rule to determine if a traveller contributed to ERP. This meant that in order for a person to contribute to NOM they must stay in or be absent from Australia for a continuous period of 12 out of 12 months. It compared data on actual travel movements over a 12 month period with data on individual travellers' duration of stay as recorded on their passenger cards. In order to conduct such a comparison, data for a 15 month period (i.e. one year plus one quarter) were required. For more detail see *Demography Working Paper 2003/5 - Net Overseas Migration: Adjusting for Actual Duration of Stay or Absence, 2003* (cat. no. 3137.0).

15 Australia's official population counts and estimates of NOM include all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. Therefore, foreign diplomatic personnel and their families are considered out of scope and need to be removed from NOM estimates. The previous methodology for estimating NOM was unable to exclude diplomatic personnel and their families. However, with the improved NOM methodology, refinements to the NOM processing system have enabled this to occur through the use of visa information. All diplomatic personnel and their families have been excluded from new NOM estimates for the reference period September quarter 2006 and onwards.

Net interstate migration

16 Interstate migration is a key determinant of the accuracy of state and territory population estimates. Data on interstate migration can not be directly estimated. Instead, post-censal estimates of interstate migration are modelled using administrative by-product data. Currently the data used by the ABS are information on interstate changes of address advised to Medicare Australia and to the Department of Defence in the case of the military. The Medicare-based model used for generating post-censal estimates of interstate migration is largely superseded when new Census information becomes available.

17 When Census data on interstate movement become available, part of the process of rebasing ERPs for states and territories is the re-derivation of interstate migration for the intercensal period. The overall approach is to minimise state intercensal error using data analysed from the Census questions concerning an individual's place of residence one-year ago, five-years ago and at Census night. When new Census data are available, interstate migration estimates for the intercensal period are replaced with estimates derived from Census data on place of usual residence five years ago if it reduces intercensal error. These estimates are then scaled so that they sum to zero at the Australian level. A similar process is carried out for the year prior to the Census, using Census data on place of usual residence one year ago. The difference between the original interstate migration estimates and the rebased estimates is apportioned across all quarters, movement categories, ages and sex categories in the intercensal period in order to minimise quarterly change.

18 Changes to the model with updated expansion factors have now been applied to interstate migration estimates from September quarter 2006 onwards and will include the revision of preliminary estimates already published. The outcome of the review on the migration model is essentially the same as the previous model used to estimate interstate migration for 2001 to 2006. It includes updated expansion factors that have been calculated using the latest data available, including Census data and additional Medicare data used to help measure multiple movers (people who may have moved more than once during the year prior to the 2006 Census). Expansion factors are used to account for an under coverage of Medicare data by various ages and sex. The model includes the following characteristics:

- Medicare data lagged by three months (both for calculating expansion factors and for estimating progressive quarters of interstate migration);

EXPLANATORY NOTES *continued*

Net interstate migration continued

- smoothed inputs used to produce expansion factors (ie: Census, Medicare & multiple movers data were smoothed);
- capping applied to expansion factors (in contrast to the 2001-06 method);
- expansion factors applied to males aged 17 to 30 years and females aged 17 to 25 years (this differs to the age range used in the 2001-06 method);
- no smoothing applied to the expansion factors.

19 For more detailed information on the changes to the model see *Information Paper: Review of Interstate Migration Method, Mar 2009* (cat. no. 3106.0.55.001).

20 Due to the fact that the Medicare data source is an indirect measure of interstate migration, the post-censal quarterly estimates of interstate migration have long been considered the weakest measure of a component of population change at the state and territory level. For further information on the process of estimating interstate migration and the administrative data used see:

- *Information Paper: Review of Interstate Migration Method, Mar 2009* (cat. no. 3106.0.55.001)
- *Information Paper: Evaluation of Administrative Data Sources for Use in Quarterly Estimation of Interstate Migration, 2006 to 2011* (cat. no. 3127.0.55.001).

Defence force adjustment

21 Medicare theoretically covers all Australian usual residents as well as those non-Australian residents granted temporary registration. However, there are a range of Australian usual residents who do not access the Medicare system, primarily due to access to alternative health services. One group is the military. As such, estimates of interstate migration produced from the interstate migration model described in the information paper *Information Paper: Review of Interstate Migration Method, Mar 2009* (cat. no. 3106.0.55.001) are adjusted to compensate for defence force movements not covered by Medicare. These adjustments are estimated using counts of defence force personnel by age, sex and state/territory, obtained from the Department of Defence, with 70% of any change in quarterly defence numbers assumed to be due to interstate migration not otherwise covered by the model.

EXPERIMENTAL ESTIMATES AND PROJECTIONS OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION

22 Estimates of the Indigenous population are experimental in that the standard approach to population estimation is not possible because satisfactory annual data on births, deaths and internal migration are not generally available. Furthermore, there is significant intercensal volatility in census counts of the Indigenous population, thus adding to the problem of estimating the true Indigenous population. This volatility can in part be attributed to changes to the Indigenous population that can not be attributed to natural increase or interstate migration. As a result, a method based on the use of life tables is used to produce time series data. Experimental projections of the Indigenous population are based on the 2006 Census. Series A of the projections assumes declining fertility, increasing paternity, constant net interstate migration, zero net overseas migration and constant life expectancy at birth. Series B assumes declining fertility, increasing paternity, constant net interstate migration, zero net overseas migration and increasing life expectancy. For further details see *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006–2021* (cat. no. 3238.0).

OVERSEAS ARRIVALS AND DEPARTURES STATISTICS

23 Persons arriving in, or departing from, Australia provide information in the form of incoming and outgoing passenger cards (see Appendix 1). Incoming persons also provide information in visa applications (apart from people travelling as Australian or New Zealand (NZ) citizens). These and other information available to the Department of Immigration and Citizenship (DIAC) serve as a source for statistics of overseas arrivals and departures (OAD).

EXPLANATORY NOTES *continued*

OVERSEAS ARRIVALS AND DEPARTURES STATISTICS *continued*

24 In July 1998, DIAC revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Following these changes, some questions on the passenger cards were not compulsory and answers to these questions were not checked by Customs officers. The question on marital status was deleted. Data on marital status is now derived from visa applications (only for certain visa classes) and is therefore not available for Australian or NZ citizens. The changes also affect the data for 'previous country of residence' which is imputed for Australian and NZ citizens. For more information see the May 1998 issue of *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0). Since July 1998, there have been additional minor changes to both incoming and outgoing passenger cards.

25 From July 2001, DIAC adopted a new passenger card processing system which involved electronic imaging of passenger cards and intelligent character recognition of the data stored in the images. This process has yielded several improvements to the processing of passenger card data, most notably the detailed information about missing values. There have also been several changes to data quality. Further information on these changes is provided in *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0).

Scope

26 Overseas arrivals and departures statistics relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia. Similarly, these statistics exclude unauthorised arrivals.

27 For more information see *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0).

NEW METHOD FOR DEFINING RESIDENTS TEMPORARILY OVERSEAS

28 The ABS has improved the measure of net overseas migration by expanding the Australian residence criteria from 12/12 months rule to 12/16 months rule. This had implications for the measurement of residents temporarily overseas (RTOs) due to the change in residence criteria mentioned above. A final measure of RTOs could only be obtained 21 months after Census night, when actual traveller behaviour, and each traveller's true residence status on Census night (according to 12/16 month rule) could be observed. For further information on the improved measure of net overseas migration see:

- *Information Paper: Improved Methods for Estimating Net Overseas Migration, 2006* (cat.no. 3107.0.55.003)
- *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia, 2007* (cat. no. 3107.0.55.005).

POPULATION PROJECTIONS

29 Population projections presented in this publication are not predictions or forecasts. They are an assessment of what would happen to Australia's population if the assumed levels of components of population change – births, deaths and migration – were to hold for the next 50–100 years.

30 The ERP at June 2007 is the base for the projections series. The three series presented in this publication, and their assumptions are as follows:

31 Series A — assumes the Total Fertility Rate (TFR) will reach 2.0 babies per woman by 2021 and then remain constant, life expectancy at birth will continue to increase until 2056 (reaching 93.9 years for males and 96.1 years for females), NOM will reach 220,000 by 2011 and then remain constant, and high flows of interstate migration.

EXPLANATORY NOTES *continued*

POPULATION PROJECTIONS *continued*

32 Series B — assumes the TFR will decrease to 1.8 babies per woman by 2021 and then remain constant, life expectancy at birth will continue to increase each year until 2011 after which mortality improvement will decline until 2056 (reaching 85.0 years for males and 88.0 years for females), NOM will be held constant at 180,000 per year throughout the projection period, and medium flows of interstate migration.

33 Series C — assumes the TFR will decrease to 1.6 babies per woman by 2021 and then remain constant, life expectancy at birth will continue to increase each year until 2011 after which mortality improvement will decline until 2056 (reaching 85.0 years for males and 88.0 years for females), NOM will decrease to 140,000 per year by 2011 and then remain constant, and low flows of interstate migration.

34 For additional series and information (e.g. age, sex, states/territories and capital cities/balances of state) see *Population Projections, Australia, 2006 to 2101* (cat. no. 3222.0).

HOUSEHOLD PROJECTIONS

35 The ABS uses a propensity method to project numbers of households, families and living arrangements. The method identifies propensities (i.e. proportions) for people to belong to different living arrangement types from the Census of Population and Housing. Trends observed in propensities over the last four Censuses are then projected forward and applied to a projected total population (see Series B, *Population Projections, Australia, 2002 to 2101* (cat. no. 3222.0)). From these projections of living arrangements, projected numbers of families and households are derived.

36 Household estimates in Table 20 are based on the 2006 Census of Population and Housing (Census). Information obtained from the PES is used to account for dwelling undercount and dwelling misclassification in the compilation of these estimates. New projections based on the 2006 Census are expected to be available 2010.

37 Data presented in Table 21 are not intended as predictions or forecasts, but are illustrations of growth and change in the numbers of households and average household size which would occur if the assumptions about future trends in living arrangements were to prevail over the projection period. For more information see *Household and Family Projections, Australia, 2001 to 2026* (cat. no. 3236.0). The household estimates presented in Table 21 continue to be projections based on the 2001 Census and are not comparable to the 2006 estimates presented in Table 20.

CONFIDENTIALITY

38 The *Census and Statistics Act, 1905* provides the authority for the ABS to collect statistical information, and requires that statistical output shall not be published or disseminated in a manner that is likely to enable the identification of a particular person or organisation. This requirement means that the ABS must take care and make assurances that any statistical information about individual respondents cannot be derived from published data.

39 Some techniques used to guard against identification or disclosure of confidential information in statistical tables are suppression of sensitive cells, and random adjustments to cells with very small values. To protect confidentiality within this publication, some cell values may have been suppressed and are not available for publication (np) but included in totals where applicable. In these cases data may not sum to totals due to the confidentialisation of individual cells.

ROUNDING

40 In this publication population estimates and their components have sometimes been rounded. Rounded figures and unrounded figures should not be assumed to be accurate to the last digit shown. Where figures have been rounded, discrepancies may occur between sums of component items and totals.

ADDITIONAL STATISTICS AVAILABLE

42 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. Inquiries should be made to the National Information and Referral Service on 1300 135 070.

43 ABS products and publications are available free of charge from the ABS website <<http://www.abs.gov.au>>. Click on Statistics to gain access to the full range of ABS statistical and reference information.

44 Statistics of overseas arrivals and departures and related data are also published regularly by DIAC (see the Department's quarterly publication, *Immigration Update*) and by the Tourism Research Australia (on international travel and tourism).

GLOSSARY

12/12 month rule	A method for measuring an overseas traveller's duration of stay or absence in which the 12 month usual residence criterion in population estimates is measured across a 12 month period. Under a 12/12 month rule, overseas travellers must be resident in Australia for a continuous 12 month period or more to be included in the estimated resident population. Similarly, Australian residents travelling overseas must be absent from Australia for a continuous 12 month period or more to be removed from the estimated resident population.
12/16 month rule	A method for measuring an overseas traveller's duration of stay or absence which takes an approach to measure usual residence that does not have to be continuous, as opposed to the continuous approach used under a 12/12 month rule. Under a 12/16 month rule, overseas travellers must have been resident in Australia for a total period of 12 months or more, during the 16 month follow-up period to be included in the estimated resident population. The 12/16 month rule therefore takes account of those persons who may have left Australia briefly and returned, while still being resident for 12 months out of 16. Similarly, it takes account of Australians who live most of the time overseas but periodically return to Australia for short periods.
Age-specific fertility rates	Age-specific fertility rates in this publication are the number of live births (occurred or registered) during the financial year, according to age of mother, per 1,000 of the female estimated resident population of the same age at 31 December. For calculating these rates, births to mothers under 15 years are included in the 15–19 years age group, and births to mothers aged 50 years and over are included in the 45–49 years age group. Pro rata adjustment is made in respect of births for which age of mother is not given.
Average annual rate of growth	The average annual growth rate, r , is calculated as a percentage using the formula: $r = \left[\left(\frac{P_n}{P_o} \right)^{\frac{1}{n}} - 1 \right] \times 100$ where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_0 and P_n in years.
Average household size	Average household size refers to the number of persons per household in private dwellings.
Balance of state or territory	The aggregation of all Statistical Divisions (SD) within a state or territory other than its capital city SD (see Major Statistical Region in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0)).
Birth	The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as heartbeat.
Capital city	Refers to the capital city Statistical Divisions of state and territories as defined in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Category of movement	Category of movement for overseas arrivals and departures is classified according to length of stay (in Australia or overseas), as recorded by travellers on passenger cards. There are three main categories of movement: <ul style="list-style-type: none">■ permanent movements;■ long-term movements (one year or more); and■ short-term movements (less than one year). A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly

GLOSSARY *continued*

Category of movement <i>continued</i>	allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Census	The complete enumeration of a population or groups at a point in time with respect to well-defined characteristics (eg Population, Manufacturing, etc.). When the word is capitalised, "Census" usually refers to the national Census of Population and Housing.
Collection District (CD)	The smallest geographic area defined in the <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Death	Death is the permanent disappearance of all evidence of life after birth has taken place. The definition excludes deaths prior to live birth.
	For the purposes of the Deaths and Causes of Death collections conducted by the ABS, a death refers to any death which occurs in, or en route to Australia and is registered with a state or territory Registry of Births, Deaths and Marriages.
Estimated resident population (ERP)	<p>The official measure of the population of Australia is based on the concept of usual residence. It refers to all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months. It excludes overseas visitors who are in Australia for less than 12 months.</p> <p>Estimates of the Australian resident population are generated on a quarterly basis by adding natural increase (the excess of births over deaths) and net overseas migration (NOM) occurring during the period to the population at the beginning of each period. This is known as the cohort component method, and can be represented by the following equation:</p> <p>$P_{t+1} = P_t + B - D + NOM$, where:</p> <p>$P_t$ = the estimated resident population at time point t</p> <p>P_{t+1} = the estimated resident population at time point t+1</p> <p>B = the number of births occurring between t and t+1</p> <p>D = the number of deaths occurring between t and t+1</p> <p>NOM = net overseas migration occurring between t and t+1.</p> <p>For state and territory population estimates, an additional term is added to the equation representing net interstate migration (NIM) occurring between t and t+1, represented by the following equation:</p> <p>$P_{t+1} = P_t + B - D + NOM + NIM$.</p>
Household	<p>A household is a group of two or more related or unrelated people who usually reside in the same dwelling who regard themselves as a household and who make common provision for food or other essentials for living; or a person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person. Households include group households of unrelated persons, same-sex couple households, single-parent households as well as one-person households.</p> <p>A household usually resides in a private dwelling (including caravans etc. in caravan parks). Persons usually resident in non-private dwellings, such as hotels, motels, boarding houses, gaols and hospitals, are not included in household estimates.</p> <p>This definition of a household is consistent with the definition used in the census.</p>
Household population	The household population is the estimated resident population (ERP) that usually lives in private dwellings. It is the ERP less the population that usually lives in non-private dwellings.
Infant death	An infant death is the death of a live-born child who dies before reaching his/her first

GLOSSARY *continued*

birthday.

Infant mortality rate (IMR) The number of deaths of children under one year of age in a financial year per 1,000 live births in the same financial year.

Intercensal discrepancy Intercensal discrepancy is the difference between two estimates at 30 June of a Census year population: the first based on the latest Census, and the second arrived at by updating the 30 June estimate of the previous Census date estimate with intercensal components of population change which take account of information available from the latest Census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source. For further information see *Population Estimates: Concepts Sources and Methods, 2009* (cat. no. 3228.0.55.001).

Intercensal error Intercensal error is the difference between two estimates at 30 June of a Census year population: the first based on the latest Census and the second arrived at by updating the 30 June estimate of the previous Census year with intercensal components of population change which do not take account of information available from the latest Census. For further information see *Population Estimates: Concepts Sources and Methods, 2009* (cat. no. 3228.0.55.001).

Local Government Area (LGA) LGA is a spatial unit which represents the whole geographical area of responsibility of an incorporated Local Government Council, an Aboriginal or Island Council in Queensland, or a Community Government Council (CGC) in the Northern Territory. An LGA consists of one or more SLAs. LGAs aggregate directly to form the incorporated areas of states/territories. The creation and delimitation of LGAs is the responsibility of the state and territory Governments. The number of LGAs, their names and their boundaries vary over time. Further information concerning LGAs is contained in *Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)* (cat. no. 1216.0).

Long-term arrivals Long-term arrivals comprise:

- overseas migrants (compromising visitors and temporary entrants) who intend to stay in Australia for 12 months or more (but not permanently); and
- Australian residents returning after an absence of 12 months or more overseas.

Long-term departures Long-term departures comprise:

- Australian residents who intend to stay abroad for 12 months or more (but not permanently); and
- overseas visitors departing who stayed 12 months or more in Australia.

Long-term departures comprise:

- Australian residents who intend to stay abroad for 12 months or more (but not permanently); and
- overseas visitors departing who stayed 12 months or more in Australia.

Median age For any distribution the median value is that which divides the relevant population into two equal parts, half falling below the value, and half exceeding it. Thus, the median age is the age at which half the population is older and half is younger.

Migration adjustment Under the previous NOM method the ABS applied a number of adjustments to overseas arrivals and departures data in order to produce estimates of net overseas migration (NOM). These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour. Until recently, adjustments used by ABS to produce NOM estimates were collectively referred to as 'category jumping adjustments'. They are now referred to more simply as 'migration adjustments'.

Natural increase Excess of births over deaths.

Net interstate migration The difference between the number of persons who have changed their place of usual residence by moving into a given state or territory and the number who have changed their place of usual residence by moving out of that state or territory during a specified time period. This difference can be either positive or negative.

GLOSSARY *continued*

Net overseas migration (NOM)	Net overseas migration is the net gain or loss of population through immigration to Australia and emigration from Australia. It is: <ul style="list-style-type: none">■ based on an international travellers' duration of stay being in or out of Australia for 12 months or more;■ the difference between the number of incoming travellers who stay in Australia for 12 months or more and are added to the population (NOM arrivals) and the number of outgoing travellers who leave Australia for 12 months or more and are subtracted from the population (NOM departures). When using the current method for estimating final net overseas migration this term is then based on a travellers' actual duration of stay or absence using the 12/16 rule. Preliminary NOM estimates are modelled on patterns of traveller behaviours observed in final NOM estimates for the same period two years earlier.
NOM arrivals	NOM arrivals are all overseas arrivals that contribute to net overseas migration (NOM). It is the number of incoming international travellers who stay in Australia for 12 months or more and are added to the population. When using the current method for estimating net overseas migration this term is then based on a travellers' actual duration of stay using the 12/16 rule.
NOM departures	NOM departures are all overseas departures that contribute to net overseas migration (NOM). It is the number of outgoing international travellers (Australian residents and long term visitors to Australia) who leave Australia for 12 months or more and are subtracted from the population. When using the current method for estimating net overseas migration this term is then based on a travellers' actual duration of absence using the 12/16 rule.
Net permanent and long-term movement	Under the previous NOM method, the difference between the number of permanent (settler) and long-term arrivals and the number of permanent and long-term departures. Short-term movements are excluded.
Net undercount	The difference between the actual Census count (including imputations) and an estimate of the number of people who should have been counted in the Census. This estimate is based on the PES conducted after each Census. For a category of person (e.g. based on age, sex and state of usual residence), net undercount is the resultant of Census undercount, overcount, misclassification and imputation error.
Overseas arrivals and departures (OAD)	Overseas arrivals and departures (OAD) refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on incoming and outgoing passenger cards. Statistics on OAD relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).
Permanent arrivals (settlers)	Permanent arrivals (settlers) comprise: <ul style="list-style-type: none">■ travellers who hold migrant visas (regardless of stated intended period of stay);■ New Zealand citizens who indicate an intention to settle; and■ those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens). This definition of settlers is used by the Department of Immigration and Citizenship (DIAC). Prior to 1985 the definition of settlers used by the Australian Bureau of Statistics (ABS) was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the DIAC.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they are departing permanently.

GLOSSARY *continued*

Post enumeration survey	The Census Post Enumeration Survey (PES) is a household survey conducted three to four weeks after the Census. The PES allows the ABS to estimate the number of people missed in the Census and the number counted more than once. Usually more people are missed than counted more than once in Australia, leading to a net undercount. Results from the PES contribute to a more accurate calculation of the estimated resident population (ERP) for Australia and the states and territories which is then backdated to 30 June of the Census year.
Population growth	For Australia, population growth is the sum of natural increase and net overseas migration. For states and territories, population growth also includes net interstate migration. After the census, intercensal population growth also includes an allowance for intercensal discrepancy.
Population projections	The ABS uses the cohort-component method for producing population projections of Australia, the states, territories, capital cities and balances of state. This method begins with a base population for each sex by single year of age and advances it year by year, for each year in the projection period, by applying assumptions regarding future fertility, mortality and migration. The assumptions are based on demographic trends over the past decade and longer, both in Australia and overseas. The projections are not predictions or forecasts, but are simply illustrations of the change in population which would occur if the assumptions were to prevail over the projection period. A number of projections are produced by the ABS to show a range of possible future outcomes. Population projections are not predictions or forecasts. They are an assessment of what would happen, in future years, to Australia's population given a set of assumptions about future trends in fertility, mortality and migration.
Sex ratio	The sex ratio relates to the number of males per 100 females. The sex ratio is defined for the total population, at birth, at death and among age groups by appropriately selecting the numerator and the denominator of the ratio.
Short-term arrivals	Short-term arrivals comprise: <ul style="list-style-type: none">■ overseas visitors/migrants who intend to stay in Australia for less than 12 months; and■ Australian residents returning from overseas after an absence of less than 12 months.
Short-term departures	Short-term departures comprise: <ul style="list-style-type: none">■ Australian residents who intend to stay abroad for less than 12 months; and■ overseas visitors departing after a stay of less than 12 months in Australia.
Standardised death rate (SDR)	Standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The ABS standard populations relate to the years ending in 1 (e.g. 1991). The current standard population is all persons in the Australian population at June 2001. SDRs are expressed per 1,000 or 100,000 persons. There are two methods of calculating SDRs: <ul style="list-style-type: none">■ The <i>direct method</i> – this is used when the populations under study are large and the age-specific death rates are reliable. It is the overall death rate that would have prevailed in the standard population if it had experienced at each age the death rates of the population under study; and■ The <i>indirect method</i> – this is used when the populations under study are small and the age-specific death rates are unreliable or not known. It is an adjustment to the crude death rate of the standard population to account for the variation between the actual number of deaths in the population under study and the number of deaths which would have occurred if the population under study had experienced the age-specific death rates of the standard population. Wherever used, the definition adopted is indicated.
State or territory and Statistical Local Area of usual residence	State or territory and Statistical Local Area (SLA) of usual residence refers to the state or territory and SLA of usual residence of: <ul style="list-style-type: none">■ the population (estimated resident population);■ the mother (birth collection); and

GLOSSARY *continued*

State or territory and Statistical Local Area of usual residence <i>continued</i>	■ the deceased (death collection). In the case of overseas movements, state or territory of usual residence refers to the state or territory regarded by the traveller as the one in which he/she lives or has lived. State or territory of intended residence is derived from the intended address given by settlers, and by Australian residents returning after a journey abroad. Particularly in the case of the former, this information does not necessarily relate to the state or territory in which the traveller will eventually establish a permanent residence.
Statistical District (S Dist)	Statistical Districts (S Dist) consist of selected, significant, predominantly urban areas in Australia which are not located within a Capital City Statistical Division (SD). S Dists enable comparable statistics to be produced about these selected urban areas. Further information concerning S Dists is contained in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Division (SD)	Statistical Divisions (SD) consist of one or more Statistical Subdivisions (SSD). These are designed to be relatively homogeneous regions characterised by identifiable social and economic units within the region, under the unifying influence of one or more major towns or cities. Information concerning SDs is contained in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Local Area (SLA)	Statistical Local Areas (SLA) are, in most cases, identical with, or have been formed from a division of, whole Local Government Areas (LGA). In other cases, they represent unincorporated areas. In aggregate, SLAs cover the whole of a state or territory without gaps or overlaps. In some cases legal LGAs overlap statistical subdivision boundaries and therefore comprise two or three SLAs (Part A, Part B and, if necessary, Part C). Further information concerning SLAs is contained in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Subdivision (SSD)	Statistical Subdivisions (SSD) are of intermediate size, between Statistical Local Areas (SLA) and Statistical Divisions (SD). In aggregate, they cover the whole of Australia without gaps or overlaps. They are defined as socially and economically homogeneous regions characterised by identifiable links between the inhabitants. In the non-urban areas an SSD is characterised by identifiable links between the economic units within the region, under the unifying influence of one or more major towns or cities. Further information concerning SSDs is contained in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Total fertility rate (TFR)	The sum of age-specific fertility rates (live births at each age of mother per female population of that age). It represents the number of children a female would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life.
Under enumeration	See net undercount.
