NOTE :—The following is an example of the method of interpreting this table :—If the rates of mortality experienced in Australia during the decennium 1881-90 remained in operation throughout the lifetime of a group of males who numbered 100,000 at birth, the number surviving at age 30 would be 70,531. The corresponding numbers for the experience of 1891-1900, and 1901-10 are 75,706 and 80,844 respectively.

NOTE:—The following is an example of the method of interpreting this table:—If the rates of mortality experienced in Australia during the decennium 1881-90 had remained in operation throughout the lifetime of any group of males, the average period beyond age 30 lived by each of those who reached age 30 would have been 33.642 years. The corresponding figures for the experience of 1891-1900 and 1901-10 are 35.110, and 36.520 respectively.
