Employment can provide an individual with benefits in terms of financial security, self-esteem and social engagement. Families with no employed parent may be at risk of economic disadvantage and reduced social opportunities, and these in turn may impact on the wellbeing of the family members.

Children are amongst the most vulnerable of the family members and may be at greater risk of experiencing financial hardship and income poverty. Furthermore, a child’s future development, social position and relative economic success may depend on their access to economic resources during the first 15 years of life.1 Living without an employed parent may also raise the risk of these children growing up to be jobless themselves.2 However, while studies point to a higher incidence of poor outcomes for children living without an employed parent, it is important to note that results do not indicate a simple deterministic pattern – that is, childhood experiences of family joblessness do not necessarily result in adverse outcomes. In some circumstances living without an employed parent may be positive for the child, for example if the parents choose not to work in order to care for the child. A parent may also undertake study and this may mean that the economic wellbeing of the family is improved in the longer term.

The Social Inclusion Board recently reported that Australia has one of the highest levels of joblessness amongst families of all developed countries in the OECD.3–5 Jobless families with children have been identified by the Australian Government as a top priority for the Australian Social Inclusion Board to address.

Changes over time

In 2007–08, there were 266,000 families with at least one child aged less than 15 years with no employed parent. Jobless families as a proportion of all families with children decreased from 18% in 1997–98 to 12% in 2007–08. This overall fall can partly be related to the decade’s economic growth, when the unemployment rate fell from 7.7% in 1998 to 4.2% in 2008. During this time, the percentage of couple families who were jobless decreased from 8.4% in 1997–98 to 3.6% in 2007–08.

Over the same decade, the proportion of one-parent families with no employed resident parent also decreased, from 54% to 44%. This may be related to the increased availability of part-time work, increased economic prosperity over the decade and changes to government policies.
policy. These changes included the introduction of childcare benefits and rebates, and changes in eligibility requirements to the Parenting Payment.

While the overall proportion of families with no employed parent has decreased over the past decade, there has been a shift in the distribution of couple and one-parent families. In 1997–98 one-parent families made up three-fifths (61%) of all families without an employed parent, but by 2007–08 this had increased to around three-quarters (76%). Most jobless one-parent families were headed by mothers (93%).

Family composition

In 2007–08 over 500,000 children aged less than 15 years lived in a family with no employed parent, and almost three-quarters (73%) of these children lived in one-parent families.

Of all children living in one-parent families, half lived with no employed parent. Of all children living in couple families, 4.2% lived with no employed parent.

In approximately half (47%) of all jobless families, the youngest child was aged less than five years. In a further 32% of these families the youngest child was aged between five and nine years, and in the remaining 21% the youngest child was aged between 10 and 14 years.

In almost half (47%) of jobless one-parent families the youngest child was aged less than five years compared with one-quarter (25%) of one-parent families where the resident parent was employed. This suggests that caring for a young child may be an important reason for parents not working, particularly in one-parent families.

Families with no employed parent were more likely to have a larger number of children than families with at least one employed parent.

Household income

The economic wellbeing of a family is largely determined by its income and housing circumstances. Looking at the distribution of income across all jobless families (couple and one-parent) a substantial majority (81%) had a weekly equivalised household income in the lowest 20%, compared with 12% of families with at least one employed parent. This difference was more pronounced for one-parent families where around one-fifth (19%) of jobless one-parent families had three or more children aged less than 15 years, compared with under one-tenth (8.4%) of one-parent families where the resident parent was employed.

A very small proportion of all jobless families (around 5%) had a weekly equivalised household income in the top 60% compared with almost two-thirds (63%) of families with at least one employed parent.

**...principal source of income**

The vast majority (90%) of all families with no employed parent received their principal source of income from government pensions and allowances, compared with just 6% of families with at least one employed parent.

Approximately 6% of jobless one-parent families received their principal source of income from other sources – this includes income from child support payments.
Socioeconomic factors

The Socio-Economic Index of Disadvantage (SEIFA) summarises the attributes of an area in which people live (including low income, low educational attainment and unemployment). Geographical areas are ranked according to their index score, with the first quintile made up of the most disadvantaged areas and the fifth quintile made up of the least disadvantaged areas.

Almost one-third (29%) of the families living in areas of greatest relative disadvantage were jobless compared with around 3% of jobless families living in areas of lowest relative disadvantage. Of the 121,000 jobless families living in the areas of greatest relative disadvantage a substantial majority (79%) were one-parent families.

...tenure

For most families the provision of ongoing housing is usually their largest single expense. For families which own their homes it is commonly their largest asset and one that provides a key economic resource for maintaining their economic wellbeing. This analysis measures the tenure type of the head of the family.

Over 190,000 families with no employed parent were renters and of these families the vast majority (81%) were one-parent families. Of all jobless families who were renting, 36% were renting from a state or territory housing authority and 62% were renting from a private landlord.

Families with no employed parent were less likely to own their own home (with or without a mortgage) (25%) than families with at least one employed parent (72%).

Other employed people in the household

The employment status of the parents is particularly influential on the child in terms of economic wellbeing and offering a working role model. Most jobless families live in single family households where no person is employed, however some live in households where other related or unrelated people may be working, for example older siblings. While the employed person’s income is not necessarily shared it may contribute to the family’s economic wellbeing by, for example, contributing to shared dwelling costs. These employed people may also offer a role model for the child in terms of work ethics and social responsibility.

In 2007–08, around 14% of jobless families (couple and one-parent) lived in households where someone else was employed. Most of these (around 82%) were one-parent families.
Looking ahead

The Australian Government has identified addressing the incidence and needs of jobless families with children as a priority. Professor Peter Whiteford has been commissioned by the Australian Social Inclusion Board to undertake work in this area. In 2009 Whiteford reported that “family joblessness is one of the most significant problems facing Australian society today,” stating that the number of jobless families had increased since 2008. Whiteford maintained that new policies are needed to support families in entering and staying attached to the workforce to ensure that new generations of children are not disadvantaged by family joblessness.

Endnotes

3 Organisation for Economic Co-operation and Development (OECD).

4 For the purpose of this income focused analysis, jobless families will be measured at a household level. In this section jobless families or families with no employed parent refer to families with dependent children living in single family households where no adult in the household is employed. Income estimates are equivalised to take into account household size and composition.

5 Non-school qualifications include Postgraduate Degree, Graduate Diploma/Graduate Certificate, Bachelor Degree, Advanced Diploma/Diploma and Certificate Level.

7 This refers to jobless families living in single family households.
