## CONTENTS

# NOTES ON THE ESTIMATES

## MAIN FEATURES

***NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory Notes under Interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, and therefore to the estimated magnitude of change in gross non-farm product.***

### ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

**.. not applicable**

**In current price seasonally adjusted terms, wages, salaries and supplements rose by 1.2 per cent in both December quarter 1986 and March quarter 1987, while gross operating surplus of trading enterprise companies rose 1.6 per cent in March quarter 1987 following a rise of 16.3 per cent in the previous quarter.**

The following notes are provided to aid analysis of the estimates for recent quarters.

**Changes in this issue**

Quarterly estimates of wages, salaries and supplements for each State and Territory are presented for the first time in Table 32 of this publication. The principal data source used to compile these estimates is the quarterly Survey of Employment and Earnings (SEE). Estimates of wages, salaries and supplements for Australia for the latest quarter are based on preliminary SEE data which do not provide sufficiently reliable estimates at the State level to permit publication of State details for the latest quarter at this stage.

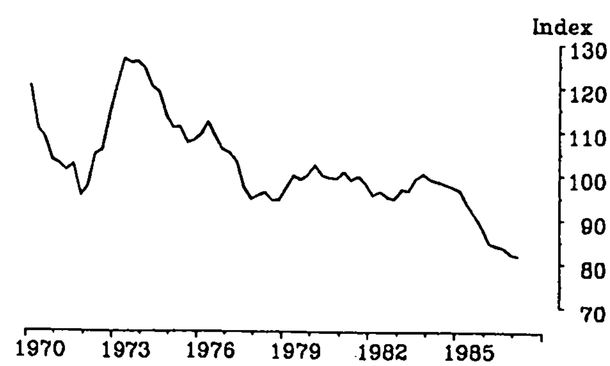
It should be noted that data for various national accounting measures previously included in 'Notes on the Estimates' are now incorporated as memorandum items to the relevant tables within this publication (see paragraph 12 of the 'Explanatory Notes' for table references).

**Terms of trade**

Initial estimates indicate that Australia's *terms of trade* declined slightly in March quarter 1987. The small increase in the price of imports was a little greater than the increase in the price of exports. The sharp decline in the *terms of trade* of 3.5 per cent in December quarter 1986, as reported in the previous issue of this publication, has been revised to a decline of 1.8 per cent. This change reflects a downward revision in the estimated price of imports and an upward revision in the price of exports for December quarter 1986.

Movements in Australia's terms of trade are shown in the graph below.

TERMS OF TRADE
(1979–80 = 100)
SEASONALLY ADJUSTED

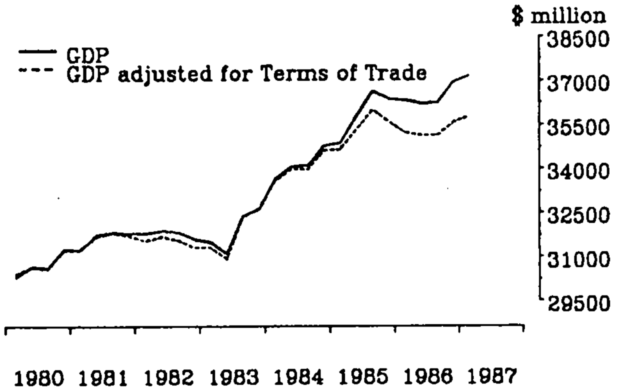


**Gross domestic product (GDP) at constant prices, adjusted for the terms of trade**

Changes in the aggregate 'Gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison the aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production.

The following graph shows constant price GDP before and after adjustment for the terms of trade effect.

GDP AT AVERAGE 1979–80 PRICES
(ADJUSTED FOR TERMS OF TRADE EFFECT)
SEASONALLY ADJUSTED

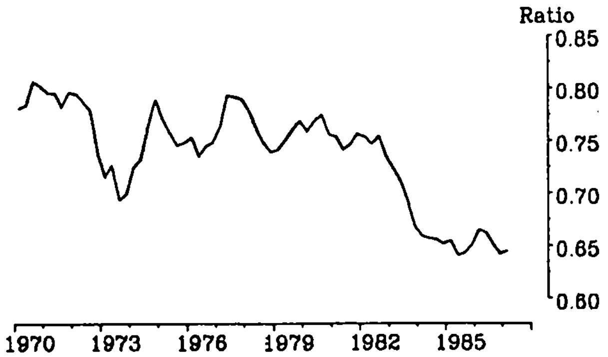


**Stocks to sales ratio**

In seasonally adjusted constant price terms private non-farm stocks increased by $131 million during March quarter 1987 while sales (see paragraph 10 of the 'Explanatory Notes') increased by $52 million. Consequently there was a small increase in the stocks to sales ratio to 0.645. The stocks to sales ratio for December quarter 1986 has been revised from 0.648 to 0.642 principally as a consequence of an upward revision to gross non-farm product at constant prices.

The following graph shows this ratio from March quarter 1970 onwards.

RATIO OF PRIVATE NON–FARM STOCKS TO SALES
AT AVERAGE 1979–80 PRICES
SEASONALLY ADJUSTED

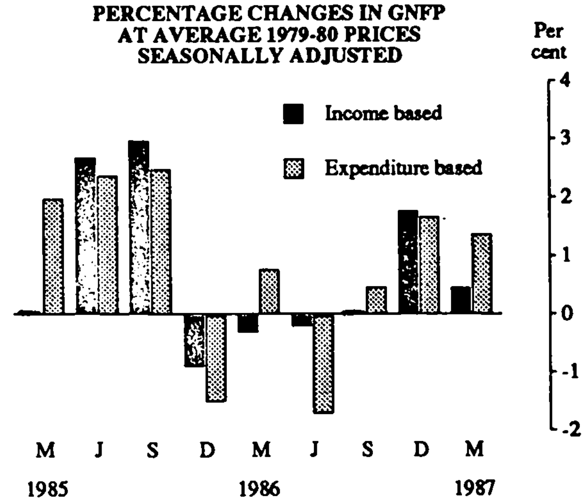


**Statistical discrepancy**

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following chart shows such a comparison for the last 9 quarters.

PERCENTAGE CHANGES IN GNFP
AT AVERAGE 1979-80 PRICES
SEASONALLY ADJUSTED

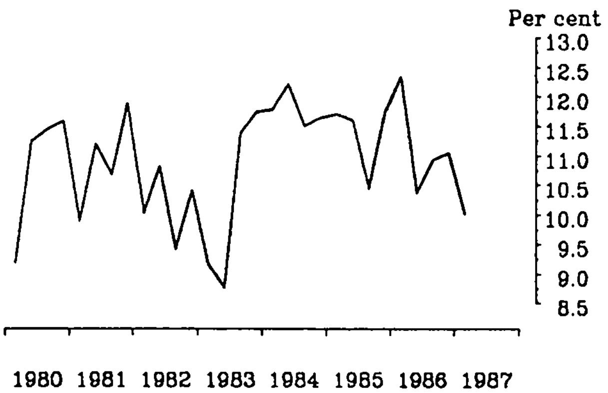


**Household saving ratio**

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the March quarter was 90.0 per cent while household saving, which is derived as a balancing item, represented 10.0 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The following graph presents this ratio from March quarter 1970.

HOUSEHOLD SAVING RATIO
SEASONALLY ADJUSTED



The household saving ratio for March quarter 1987 is the lowest recorded since June quarter 1983. The fall in the household saving ratio in March quarter 1987 should be interpreted in the light of greater than normal income tax payments by provisional tax payers. The strength of these payments in March quarter 1987 may be attributed, in part, to a sharp increase in the volume of assessments issued early by the Australian Taxation Office causing a higher than usual proportion of provisional tax to be paid in March (before the due date) rather than in later months.

**Revisions**

Revisions have been made to estimates for recent quarters, particularly December quarter 1986, as a result of incorporating more complete data. In particular, estimates of gross operating surplus for both companies and unincorporated enterprises have been revised since the December quarter issue. As a result of these revisions the estimate of growth in GDP in December quarter 1986 has been revised from 1.1 per cent to 1.9 per cent, while growth in gross non-farm product has been revised from 0.9 per cent to 1.8 per cent.

## EXPLANATORY NOTES

**Introduction**

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the March quarter 1987, together with comparative estimates for the eight previous quarters and the four years 1982-83 to 1985-86. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the March quarter 1987, together with comparative estimates for the twelve previous quarters.

**Concepts, definitions, sources and methods**

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1985-86* (5204.0).

3. In previous issues of this publication certain additional measures were presented in the 'Notes on the Estimates'. These measures, which are now presented in the tables, are briefly described below.

*Terms of trade*

4. There are several ways of measuring the terms of trade. A common means of doing so is by calculating an index of the form:

$$\frac{\text{Price index of exports}}{\text{Price index of imports}} \times 100$$

5. In this publication the price indexes used in calculating the terms of trade are the implicit price deflators for exports of goods and services and for imports of goods and services. They take into account not only the changes in the prices of exports and imports, but also the effects of changes in the composition of exports and imports on total recorded price movements.

*Gross domestic product (GDP) at constant prices, adjusted for the terms of trade*

6. Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison, the aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production.

7. As with the terms of trade, no single agreed measure of the effect of the terms of trade on movements in GDP at constant prices is available, partly because the available methods may produce different results.

8. In this publication the adjustment has been calculated by first revaluing exports of goods and services by the implicit price deflator of imports of goods and services (thereby providing a measure of the purchasing power of exports over imports). The actual constant price value of exports of goods and services has then been deducted from this value to provide the terms of trade adjustment which has been added to GDP at constant prices to obtain the required result.

*Expenditure-based estimate of gross non-farm product*

9. The published measure of GDP is the sum of the income components in the domestic production account. Alternatively expenditure-based estimates of GDP and gross non-farm product can be produced by subtracting the statistical discrepancy from the published estimates. Conceptually the two sets of estimates are identical.

*Private non-farm stocks to sales ratio at constant prices*

10. The denominator of this ratio is defined as gross non-farm product *plus* imports of goods and services (excluding imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) *less* changes in private non-farm stocks. All of these variables are at constant prices.

*Household saving ratio*

11. This is defined as the ratio of household saving to household disposable income, where household saving is a balancing item derived as the difference between household disposable income and private final consumption expenditure.

**Changes in this issue**

12. The additional measures referred to above have been incorporated in the tables of this publication as set out below.

- terms of trade, seasonally adjusted (Table 9)
- gross domestic product at average 1979-80 prices, adjusted for the terms of trade, seasonally adjusted (Table 8)
- expenditure-based gross non-farm product at average 1979-80 prices, seasonally adjusted (Table 8)
- private non-farm stocks to sales ratio at average 1979-80 prices, seasonally adjusted (Table 8)
- household saving ratio, seasonally adjusted (Table 23)

Where appropriate percentage changes for these measures have been included in Table 2 or Table 4.

13. A dissection of wages, salaries and supplements, by State and Territory has been included for the first time (see Table 32).

**Interpretation of quarterly estimates**

14. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation in the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

15. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

16. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

17. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types — those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

18. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter-to-quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +$35 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

19. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original

(i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

**Seasonal adjustment**

20. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In a number of tables *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

21. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

22. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

**Analysis of contributions to growth table**

23. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t)-A(t-1)}{GDP\ (t-1)} \times 100.0$$

where A(t)= value of aggregate A in quarter under consideration

A(t-1)= value of aggregate A in preceding quarter

GDP(t-1)=value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage change tables shown elsewhere in this publication.

**Rounding of figures**

24. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

25. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

**Related publications**

26. In addition to those mentioned above other ABS publications which may be of interest include:

*Historical Series of Estimates of National Income and Expenditure, Australia* (5207.0) — issued for December quarter only.

*Australian National Accounts, Gross Product by Industry, 1984-85* (5211.0)

Budget Paper: *National Income and Expenditure, 1985-86* (5213.0)

27. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

**Electronic services**

28. VIATEL. Key *656# for selected current economic, social and demographic statistics.

AUSSTATS. Thousands of up-to-date time series are available on this ABS on-line service through CSIRONET.

For further information phone the AUSSTATS Help Desk on (062) 52 6017.

TELESTATS. This service provides foreign trade statistics tailored to users' requirements.

Further information is available on (062) 52 5404.
