Trend estimates for the most recent months may be revised as data for subsequent months become available. For example, if the January seasonally adjusted estimate shows a 1.0 per cent rise, then the movement in the trend estimate for January would be 0.0 per cent. December would be revised upwards by 0.1 percentage points while November would remain unchanged. A 1.0 per cent fall in the seasonally adjusted estimate would produce a movement in the trend estimate for January of -0.3 per cent, and December and November would be revised downwards by 0.1 and 0.2 percentage points respectively. See paragraphs 23 and 24 of the Explanatory Notes.

SUMMARY OF FINDINGS

CHART 1: TURNOVER OF RETAIL AND SELECTED SERVICE ESTABLISHMENTS, MONTHLY ESTIMATES, AUSTRALIA

Australian estimates

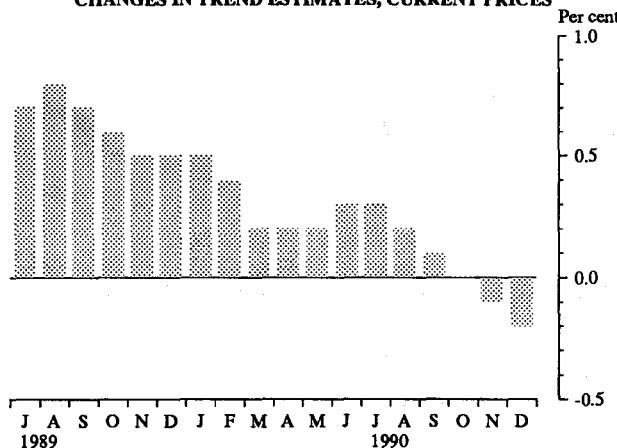

Turnover for retail (excluding motor vehicle dealers, service stations, etc.) and selected service establishments covered by the survey is in decline with trend estimates showing an average decrease of 0.1 per cent per month for the three months ended December.

Average monthly growth in the trend estimates over the past 12 months has now dropped to 0.2 per cent. The annual growth rate (December 1990 on December 1989) is 2.4 per cent.

In seasonally adjusted terms turnover for December fell 0.9 per cent over November 1990. In original terms, retail and selected service establishment turnover rose 25.7 per cent to \$9395.1m.

Note: At the time this publication went to print, constant price data for the December quarter were not yet available but will be included in a special supplement to be released in about a fortnights time.

CHART2: TURNOVER OF RETAIL AND SELECTED SERVICE ESTABLISHMENTS, AUSTRALIA, MONTHLY PERCENTAGE CHANGES IN TREND ESTIMATES, CURRENT PRICES

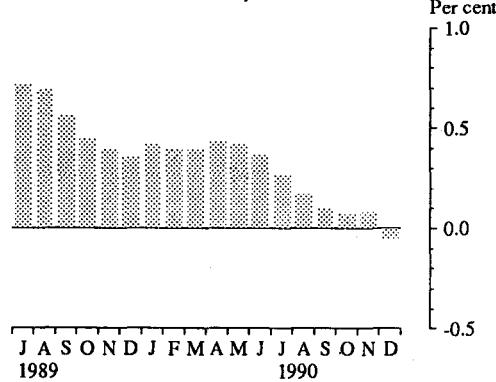

Industry trends

The trend estimates show that the grocery industry is still experiencing moderate growth. Clothing and fabric stores are showing no growth while Department and general stores and Hotels, liquor stores and licensed clubs are in decline. Of the remaining industries Footwear stores are now showing strong growth following a period of decline earlier in 1990, while the remainder are showing weak to moderate growth or are in decline.

PERCENTAGE CHANGE IN TREND ESTIMATES OF TURNOVER

Industry	Average monthly increase for 3 months to December 1990	Average monthly increase for 12 months to December 1990
Grocers	0.6	0.7
Hotels, liquor stores, licensed clubs	-0.5	0.2
Department and general stores	-0.1	0.2
Clothing and fabrics stores	-0.0	0.3
Total all industries	0.0	0.1

CHART3: TURNOVER OF RETAIL ESTABLISHMENTS, AUSTRALIA, MONTHLY PERCENTAGE CHANGES IN TREND ESTIMATES, CURRENT PRICES

Analysis of the *retail only* industries in total shows growth averaging less than 0.1 per cent per month over the last 3 months. Over the past year (December 1990 over December 1989) the *retail* industries have shown growth in turnover of 3.1 per cent, which is 0.9 percentage points higher than the all industries growth rate over the same period.

State trends

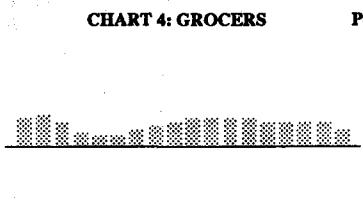

Trend estimates for South Australia showed an average growth rate of just over 1.0 per cent for the three months ended December.

Queensland is currently showing weak growth while the remaining States are in decline.

NOTE: Explanatory Notes are at the back of this publication.

NOTE: Series is not long enough to provide sufficient information to allow reliable seasonal adjustment estimates.

EXPLANATORY NOTES

Introduction

This publication presents monthly retail trade series based on estimates of the value of turnover of retail establishments classified by industry, and by State. These series replace the statistics based on the value of retail sales published up to June 1988.

2. From June 1988 the series in this publication are based on turnover data obtained from a sample of retail establishments. For the period until June 1988 the series have been adjusted to a turnover basis using movements in the previous retail sales series. Linked historical data are available on AUSSSTATS, or can be provided by the ABS. More information on the survey methodology and the procedures used to link statistics for the new series with those for months prior to June 1988 are contained in the Information Paper: *Introduction of Improved Monthly Retail Trade Statistics (8511.0)*.

Scope and coverage

3. The estimates of turnover are derived from a survey covering all States and the two Territories. It includes in its scope all retail trade establishments classified to ASIC subdivision 48, *except* motor vehicle dealers, service stations, etc (ASIC classes 4861-4868); milk and bread vendors (4878-4879); shoe repairers (4846); and electrical appliance repairers n.e.c. (4857). *Also included* are cafes and restaurants (9231); hotels, etc. (mainly drinking places) (9232); licensed clubs (9241-9243); and hairdressers (9351-9352).

4. Retail establishments which do not have employees are excluded from the coverage of the survey.

Definition of turnover

5. Turnover includes retail sales; wholesale sales; takings from repairs, meals and hiring of goods (except for rent, leasing and hiring of land and buildings); and commissions from agency activity (e.g. commissions received from collecting dry cleaning, selling lottery tickets, etc).

Industry detail

6. The names of the industries for which statistics are published in this bulletin align with the titles given in ASIC, except for the following groupings:

Other food stores: ASIC classes 4883, 4885, 4886

Hotels, liquor stores, licensed clubs: ASIC classes 9232, 4884, 9241, 9242, 9243

Clothing and fabrics stores: ASIC classes 4843, 4844, 4847

Electrical goods stores: ASIC classes 4855, 4856

Other stores: ASIC classes 4892, 4893, 4895, 4896, 4897, 9351, 9352

Constant price statistics

7. To enable analysis of the movement of retail activity in 'real' terms, estimates of retail turnover at constant (average 1984-85) prices are compiled each quarter. Constant price retail turnover series are derived by deflating the original current price series of retail turnover by specially compiled indexes of price change.

Reliability of estimates

8. Retail trade statistics may be subject to error from various sources, which are usually classified as either sample or non-sample error.

Sample error

9. Since retail turnover is estimated from a survey which includes a sampled component, the estimates are subject to sampling error. That is, they may differ from figures that would have resulted if all enterprises with retail establishments were included in the survey. One measure of the likely difference is given by the standard error. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all inscope units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.

10. Standard errors of estimates for the latest month and of estimates of change since the preceding month are shown in the tables. An example of the use of these standard errors is given below:

The *estimated change* of \$1922.1 million (25.7 per cent) in the total value of turnover between December 1990 and November 1990 has a standard error of about \$44.1 million (0.6 per cent). Therefore, there are two chances in three that the change which would have been obtained if all units had been included in the survey would be within the range \$1878.0 million to \$1966.2 million (25.1 per cent to 26.3 per cent) and nineteen chances in twenty that the change would be within \$1833.9 million to \$2010.3 million (24.5 per cent to 26.9 per cent).

11. The standard errors for some industries in some States are relatively high and users are advised to exercise caution in interpreting movements for such series. Some users may wish to combine such industries to obtain an estimate of the combined group which is more accurate than the components. The standard error of level of any such combination of industries may be calculated by squaring the standard error for each of the component industries, adding the squared standard errors together, and taking the square root of that sum. For example, suppose the standard error of level for Industry A is \$1.5 million and the standard error for Industry B is \$2.0 million. Then the standard error for the combination of Industries A and B is $\sqrt{(1.5)^2 + (2.0)^2} = \2.5 million.

12. Standard errors of estimates of change between non-consecutive months are not shown in publication tables.

These standard errors are generally much higher than the standard errors of change between consecutive months. For example, the standard error of change between the latest month and the corresponding month of the previous year is, on average, approximately 1.4 times the standard error of level of the latest month.

13. Seasonally adjusted, trend and constant price estimates are also subject to sampling variability. For seasonally adjusted estimates, the standard errors are approximately the same percentage of the estimate as for the unadjusted series. For trend estimates, the standard errors are generally not larger than for the seasonally adjusted estimates and are likely to be smaller. For constant price estimates, the standard errors may be up to 10 per cent higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates.

Non-sample error

14. This category includes a number of possible errors that arise in any type of collection, whether or not sampling of units is undertaken. The most significant of these errors are: misreporting of data items; deficiencies in coverage; non-response; and processing errors. In some cases the presence of these errors would, at least in part, be reflected in the size of the standard error.

15. *Reporting error.* Such error may arise because of poor form design, inability by survey respondents to provide requested data, or simply because of clerical error. Every effort is made to minimise reporting error by the careful design and testing of forms, and by examining inconsistencies both between different respondents and between the reports in successive months for each respondent.

16. Turnover is a relatively simple data item to collect accurately because it corresponds closely to total takings by respondents. While some reporting errors will be random and thus cancel out, others may be consistently in one direction and lead to bias in the results.

17. *Under coverage.* Because of limited sources available to identify enterprises with no employees, only enterprises with employees are included in the new survey. Non-employing units are estimated to account for approximately 6% of total turnover but their significance varies substantially from industry to industry. While the exclusion of such units will therefore lead to consistent underestimation of the level of turnover, their exclusion is considered to have a negligible effect on short term movements in Retail Trade.

18. Some error may also arise because of lags in the identification of new businesses. Studies undertaken by the ABS suggest that these lags also have a negligible impact on short term movements but lead to a small consistent underestimation of the level of turnover each month. An improved method of updating new businesses is currently being implemented. Refer to paragraph 26 for more details.

19. *Non-response.* The survey of Retail Trade is a monthly survey conducted to tight timetables so that not all forms are received in time for publication. Extensive telephone follow up is undertaken each month to obtain details for respondents who have not returned forms by the due date. Despite this, it is necessary to impute responses for approximately 5% of selected units (which are, in the main, small retailers). The consequences of this imputation for data quality are also reflected, in part, in the size of the standard error.

20. *Processing errors.* Such errors may arise at any stage of processing. Editing procedures should detect significant errors at data entry stage, while all processing systems are thoroughly tested. Published tables are produced directly from 'camera-ready' computer output to avoid the possibility of clerical transcription errors at the tabulation stage.

Seasonally adjusted and trend estimates

21. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences can be more clearly recognised.

22. In the seasonal adjustment of the turnover estimates, account has been taken of both normal seasonal factors and 'trading-day' effects (arising from the varying length of each month and the varying numbers of Sundays, Mondays, Tuesdays, etc. in the month). For total turnover for Australia, adjustment has also been made for the effects of change in the date of Easter and Australia Day holidays. Seasonal adjustment does not remove from the series the effect of irregular influences (e.g. abnormal weather, industrial disputes) and the seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject.

23. The smoothing of seasonally adjusted series to create trend estimates is a means of reducing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson-weighted moving average to the respective seasonally adjusted series. These trend series are used to analyse the underlying behaviour of the series over time.

24. While this smoothing technique enables estimates of trend to be produced for the latest month, it does result in revisions to the estimates for the most recent months as data for subsequent months become available. Generally, subsequent revisions become smaller and after 3 months have a negligible impact on the series. To illustrate the effect of the seasonally adjusted results on the trend series movement, if the January 1991 seasonally adjusted result shows a +1.0% movement, then the trend movement would be 0.0% for January, and -0.1% for December and November. A -1.0% movement would return a trend movement of -0.3% for January, December and November.

25. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of*

'Trend' (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

Coverage adjustment

26. This survey uses as its sampling frame the ABS's register of businesses which is regularly updated to take account of new businesses and businesses ceasing operation. A major source of information on new businesses is group employer (GE) registrations with the Australian Tax Office. The ABS is developing an improved computerised system which will reduce the delay in new businesses from this source being recorded on the register, while at the same time undertaking an analysis to identify businesses which have been omitted from the register in the past. During the time these improvements to the register are being implemented, it has been necessary to temporarily suspend updating the register from GE registrations. New GE businesses will be represented in the survey result for the period June to February 1991 by including a small allowance (a 'new business provision') which is based on analysis of the contribution of such units in previous periods and taking current changes to economic conditions into consideration. When the improvements to the business register have been completed in 1991 the series in this publication may be revised to correct any deficiencies in the new business provision for surveys from June to February 1991, using information that will then be available concerning new GE businesses.

Related publications

27. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Note: This release presents the constant price data normally included in the Retail Trade, Australia publication (catalogue 8501.0). Because of the improved timeliness of the Monthly Retail Trade survey the constant price data were not available at the time the December release of Retail Trade, Australia went to print and is now being made available as a special release for users of these statistics. Table 1 from the current release has been reproduced in this special release to assist interpretation and analysis.

SUMMARY OF FINDINGS

CHART 1: TURNOVER OF RETAIL AND SELECTED SERVICE ESTABLISHMENTS, AUSTRALIA, QUARTERLY PERCENTAGE CHANGES CONSTANT PRICES, SEASONALLY ADJUSTED

After allowing for price changes, seasonally adjusted retail turnover in the December 1990 quarter fell by 1.6 per cent over the September 1990 quarter. This was the third quarter of decline in 1990 and is the largest quarterly decline since June 1983. Compared to the December 1989 quarter, the decline is also 1.6 per cent. The decline is evident in a number of industries, notably

December quarter 1990 over

	December quarter 1989	September quarter 1990
Hardware stores, jewellers	-11.7	-9.1
Furniture stores	-12.7	-7.5
Newsagents	-9.4	-8.6

On the other hand a number of industries show increases, notably

December quarter 1990 over

	December quarter 1989	September quarter 1990
Grocers, confectioners, tobacconists	+4.0	+1.1
Footwear stores	+0.8	+2.6
Pharmacies	+4.9	+0.7

New South Wales, Victoria, Western Australia and Tasmania all recorded declines of around 2 per cent compared to the September 1990 quarter. Comparing the December 1990 quarter to the December 1989 quarter, the State results vary from a decrease of 6.8 per cent in Victoria to an increase of 3.7 per cent in the Australian Capital Territory.
