Gross domestic product (GDP) declined in September quarter 1990 by 1.6 per cent in constant price seasonally adjusted terms, to be 0.7 per cent lower than in September quarter 1989. This is the first occasion since June quarter 1983 that seasonally adjusted constant price GDP has been lower than in the corresponding quarter of the previous year.

Major features of the expenditure aggregates this quarter include weak private final expenditures, strong public final expenditures, a large rundown in private non-farm stocks, flat exports and a rebound in imports.

Private non-farm stocks declined by \$799 million in seasonally adjusted constant price terms in September quarter following a decline of \$281 million in June quarter. Consequently, private non-farm stocks made a negative contribution to growth in GDP in the September quarter of 0.8 percentage points.

Following a decline in imports of goods and services of 9.7 per cent in June quarter, imports rose by 8.4 per cent in September quarter. Imports therefore made a negative contribution to growth in GDP of 1.7 percentage points in September quarter. On the other hand exports rose marginally by 0.6 per cent in the September quarter making a positive contribution to growth of 0.1 percentage points.

Government final consumption expenditure increased by 3.2 per cent in September quarter, most of the growth being recorded in the Commonwealth sector. Public trading enterprises gross fixed capital expenditure increased by 10.8 per cent, a major contributing factor being the importation of new aircraft (See also Notes on the Estimates).

## NOTES ON THE ESTIMATES

### Farm product

Gross farm product in constant price seasonally adjusted terms declined by 7.5 per cent in September quarter. The major contributors to this fall were declines in the production of wool from the very high level recorded in June quarter, and in other grain crops and other livestock products.

Gross farm product in current price seasonally adjusted terms declined by 22.3 per cent in September quarter, reflecting the production declines noted in the previous paragraph and significant falls in prices for wool and wheat. Consequently, there was a significant fall in the income of farm unincorporated enterprises (See Table 22). The fall in farm unincorporated enterprises income was also a major factor in the decline of 7.8 per cent in gross operating surplus of all unincorporated enterprises.

### Government final consumption expenditure

The rise of 3.2 percent in seasonally adjusted constant price government final consumption expenditure is due to unusually strong growth in expenditure by Commonwealth authorities.

In September quarter 1990 there were seven pay-days for many Commonwealth employees compared with six in the previous quarter. An adjustment to remove this variation has been made in the derivation of constant price estimates, but the effect of the variation remains in the current price estimates. This has been the major contributor to the sharp increase in the implicit price deflator.

### Gross fixed capital expenditure - public enterprises

The 10.8 per cent seasonally adjusted increase in public enterprises gross fixed capital expenditure is attributable to increased purchases of aircraft by Commonwealth enterprises (from \$117 million in June quarter to \$571 million in September quarter). Estimates excluding the effects of these increased purchases would show negative growth.

Largely as a consequence of the variation of expenditure on aircraft, the implicit price deflator (IPD) for gross fixed capital expenditure by public enterprises increased by 4.1 per cent in June quarter and fell by 4.5 per cent in September quarter. The price deflator for aircraft is at a relatively low level and, in combination with an increased weight being applied to it in September quarter, results in the fall observed in the overall IPD for this aggregate.

### Exports and imports of goods and services

Although constant price estimates of exports of goods and services showed little change in seasonally adjusted terms in the September quarter (up 0.6 per cent), there were substantial movements for some components. In particular, sugar, sugar preparations and honey increased by \$98 million (102 per cent) from a relatively low level in June quarter, while exports of coal, coke and briquettes fell by \$159 million (-10.2 per cent). Exports

of wool continued to decline, with a fall of \$39 million (-7.6 per cent). The implicit price deflator for wool also continued to decline (down by 6.7 per cent).

Most export groups recorded price falls in the September quarter. The fixed-weighted price index for exports of goods and services fell by 2.9 per cent, while the implicit price deflator fell by only 1.8 per cent. The difference between the two movements is attributable to compositional change.

Import volumes of all major groups grew in the September quarter in seasonally adjusted terms. However the major contributor to the growth in imports of goods and services at constant prices (8.4 per cent) was Transport equipment, which increased by \$637 million or 58.5 per cent. Much of this increase was due to the purchase of aircraft by government enterprises.

The fixed-weighted price index for imports of goods and services fell by 1.4 per cent, while the implicit price deflator fell by 2.1 per cent. The implicit price deflator for fuels fell by 4.6 per cent. This reflects the decline in the import price of fuels through the June quarter and well into the September quarter, which more than offset the sharp rise that occurred with the beginning of the Gulf crisis.

### Terms of trade

Initial estimates indicate that Australia's terms of trade rose 0.3 per cent in September quarter 1990, reflecting a decrease in export prices of 1.8 per cent and a decrease in import prices of 2.1 per cent. The implicit price deflators for both exports and imports of goods and services were affected by compositional change - see note above on the movements in export and import implicit price deflators.

Movements in Australia's terms of trade are shown in the graph below.

**Gross domestic product (GDP) at constant prices, adjusted for the terms of trade**

Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison the aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production. Since June quarter 1988 the level of GDP adjusted for the terms of trade has been higher than the level of unadjusted GDP. Over the two year period since then, both have increased by 5.1 per cent.

The following graph shows constant price GDP before and after adjustment for the terms of trade.

**GDP AT AVERAGE 1984-85 PRICES  
(ADJUSTED FOR TERMS OF TRADE EFFECT)  
SEASONALLY ADJUSTED**

**Stocks to sales ratio**

In seasonally adjusted constant price terms, private non-farm stocks decreased by \$799 million (or 1.9 per cent) during September quarter 1990, while sales (see paragraph 23 of the 'Explanatory Notes') increased by \$311 million (or 0.4 per cent). Consequently, the stocks to sales ratio fell to 0.561.

The following graph shows this ratio from September quarter 1974 onwards.

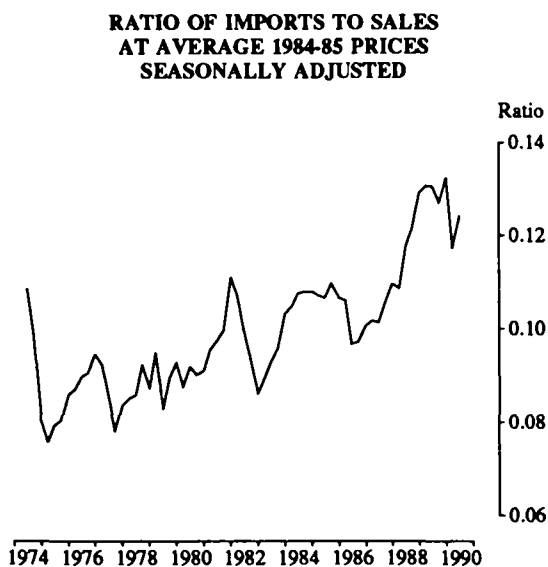

**RATIO OF PRIVATE NON-FARM STOCKS TO SALES  
AT AVERAGE 1984-85 PRICES  
SEASONALLY ADJUSTED**

### Imports to sales ratio

The imports to sales ratio (see paragraph 24 of the 'Explanatory Notes') increased to 0.124 in September quarter 1990 from 0.117 in the previous quarter. This was associated with an increase in endogenous imports of 6.3 per cent and an increase in sales of 0.4 per cent - both measured in seasonally adjusted constant price terms.

The ratio of imports to sales is presented in the following graph.

The following graph presents this ratio from September quarter 1974 onwards.

### HOUSEHOLD SAVING RATIO SEASONALLY ADJUSTED

### Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the September quarter was 93.3 per cent while household saving, which is derived as a balancing item, represented 6.7 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. Particular caution should be exercised in interpreting this ratio for recent years because major components may still be subject to significant revisions. The impact of such revisions on the saving ratio can be quite marked and can cause changes in the apparent direction of the trend.

### Revisions in this issue

Most revisions in the September quarter accounts have resulted from incorporating final survey data in respect of the June quarter. Revisions to expenditure aggregates in 1989-90 have generally been positive, hence reducing the constant price statistical discrepancy from \$4270 million to \$3318 million. Gross non-farm product at constant prices and wages, salaries and supplements have also been seasonally reanalysed. Estimates of growth in GDP for 1989-90 have not been altered although the quarterly allocation has been revised to some extent (September quarter up from 0.1 per cent to 0.7 per cent, December quarter down from -0.2 per cent to -0.5 per cent, March quarter down from 2.1 per cent to 1.9 per cent, and June quarter up from -0.9 per cent to -0.4 per cent.).

### Release date for December Quarter 1990 issue

The expected release date for the December quarter 1990 issue of *Australian National Accounts: National Income and Expenditure* (5206.0) is 21 March 1991.

## EXPLANATORY NOTES

### Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the September quarter 1990, together with comparative estimates for the eight previous quarters and the four years 1985-86 to 1988-89. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the September quarter 1990, together with comparative estimates for the twelve previous quarters. Tables 37-42 show revisions that have been made to major aggregates since the previous publication. Tables 43-55 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1974 for the aggregates contained in the domestic production account (at both current and average 1984-85 prices), some income aggregates, implicit price deflators and some other selected series.

### Concepts, definitions, sources and methods

2. An expanded version of *Australian National Accounts: Concepts, Sources and Methods* (5216.0) was released earlier this year. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at both current and constant prices and discusses the accuracy and reliability of the national accounts. In addition it now includes documentation on input-output tables, flow of funds tables, capital stock and State accounts.

### Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter and results in considerable variation in estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be taken into account when interpreting or using the estimates (for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in measuring productivity).

5. Analysis of trends requires allowance for these

uncertainties in estimation. To some extent, the effects are indicated by the changes in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types - those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However, the following example illustrates the *sensitivity* of quarter-to-quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$64 million then the measure of the rate of growth would be affected in the three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

### Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In a number of tables, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to take into account the methods by which seasonally adjusted estimates have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain these seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of this method is that changes in the annual production of these commodities enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for corresponding current price estimates.

12. Seasonally adjusted estimates of private final consumption expenditure for each State and Territory at current and average 1984-85 prices are shown in Tables 35 and 37 of this publication. Due to the relatively short span of data available for analysis, no Easter or trading-day correction factors have been applied in the seasonal adjustment of these series. The State and Territory series have been adjusted at a more aggregated level than the Australian series and independently of them (although as far as possible similar methods have been used). For these reasons the sum of the seasonally adjusted State and Territory series do not generally equal the seasonally adjusted Australian series.

### Trend estimates

13. Trend estimates of two aggregates - GDP and gross non-farm product (GNFP) - are presented in Table 8. In previous issues of this publication, they have been derived by applying a 5-term Henderson moving average to the quarterly seasonally adjusted constant price estimates. They are now derived using a 7-term Henderson moving average which produces smoother trend estimates than the 5-term. The weights of the 7-term average are as follows: -0.059, 0.059, 0.294, 0.412, 0.294, 0.059, -0.059.

14. As a moving average approaches the end of a time series and begins to run out of observations, asymmetric averages have to be used. Unlike the asymmetric weights of the standard 5-term and 7-term Henderson moving averages, the weights employees here have been tailored to suit the particular characteristics of GDP and GNFP.

15. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

### Analysis of contributions to growth table

16. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter.

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage changes shown in other tables in this publication.

### Terms of trade

17. There are several ways of measuring the terms of trade. A common means of doing so is by calculating an index of the form:

$$\frac{\text{Price index of exports}}{\text{Price index of imports}} \times 100.0$$

18. In this publication the price indexes used in calculating the terms of trade are the implicit price deflators for exports of goods and services and for imports of goods and services. They take into account not only the changes in the prices of exports and imports, but also the effects of changes in the composition of exports and imports on total recorded price movements. The terms of trade is presented as a memorandum item in Tables 4 and 9.

### Gross domestic product (GDP) at constant prices, adjusted for the terms of trade

19. Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia. If, however, the terms of trade have changed significantly over the period of comparison this aggregate will not provide an accurate reflection of the change in the real

purchasing power of the income generated by domestic production.

20. As with the terms of trade, no single agreed measure of the effect of the terms of trade on movements in GDP at constant prices is available, and the available methods will generally produce different results.

21. In this publication the adjustment has been calculated by first revaluing exports of goods and services by the implicit price deflator of imports of goods and services (thereby providing a measure of the purchasing power of exports over imports). The actual constant price value of exports of goods and services has then been deducted from this value to provide the terms of trade adjustment which has been added to GDP at constant prices to obtain the required result. The series is presented as a memorandum item in Tables 2 and 8.

#### **Expenditure-based estimate of gross domestic product**

22. The published measure of GDP is the sum of the income components in the domestic production account. Alternatively, expenditure-based estimates of GDP can be produced by subtracting the statistical discrepancy from the published estimates. Expenditure-based estimates of gross domestic product are presented as a memorandum item in Tables 2 and 8.

#### **Private non-farm stocks to sales ratio**

23. The denominator of this ratio is defined as gross non-farm product *plus* endogenous imports (imports of goods *excluding* imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) *plus* imports of services *less* changes in private non-farm stocks. All of these variables are at constant prices. The ratio is presented as a memorandum item in Table 8.

#### **Imports to sales ratio**

24. The ratio is endogenous imports to sales (both as defined for the private non-farm stocks to sales ratio - see paragraph 23). It is presented as a memorandum item in Table 8.

#### **Household saving ratio**

25. This is defined as the ratio of household saving to household disposable income, where household saving is a balancing item derived as the difference between household disposable income and private final consumption expenditure. The ratio is presented as a memorandum item in Table 23.

#### **Data on floppy disk**

26. All quarterly series included in this publication are available on floppy disk (*Australian National Accounts: Quarterly Data on Floppy Disk* (5228.0)). These data generally run from September quarter 1959 for current price estimates and from September quarter 1974 for constant price estimates. The cost is currently \$75 per

release for most customers. Order forms for the service can be obtained by telephoning (06) 252 6684.

#### **Related publications**

27. In addition to those mentioned above, other ABS publications which may be of interest include:

*Australian National Accounts: Historical Estimates* (5207.0) - issued for December quarter only

*Budget Related Paper No. 2, National Income and Expenditure* (5213.0) - issued annually

*Australian National Accounts: State Accounts* (5220.0) - issued annually

*Australian National Accounts: Capital Stock* (5221.0) - issued annually

*Australian National Accounts: Gross Product, Employment and Hours Worked* (5222.0) - issued quarterly.

*Australian National Accounts: Gross Product, Employment and Hours Worked* (5211.0) - issued annually

*Development of Multifactor Productivity Estimates for Australia, 1974-75 to 1987-88*, Information Paper (5229.0)

*A Guide to the Australian National Accounts* (5235.0)

28. Current publications produced by the ABS are listed in the *Catalogue of Publications and Australian products* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

#### **Electronic services**

**DISCOVERY.** Key \*656# for selected current economic, social and demographic statistics.

**AUSSTATS.** Thousands of up-to-date time series are available on this ABS on-line service through PAXUS COMNET. Further information can be obtained by calling the AUSSTATS Help Desk on (06) 252 6017.

**TELESTATS.** This service provides:

- foreign trade statistics tailored to users' requirements. Further information is available on (06) 252 5404.
- text and tables for selected Main Economic Indicator publications. Further information is available on (06) 252 5405.

#### **Floppy disk service**

Selected ABS statistics are available on floppy disk. Further information is available on (06) 252 6684.
