Changes in this issue —

Following each Census of Population and Housing, the ABS selects a new sample for the Labour Force Survey. This is done to ensure that the sample continues to accurately represent the distribution of the Australian population. A new sample has recently been selected based on the 1996 Census. The bulk of the new sample is being phased in over the period September 1997 to April 1998, with one eighth of this portion of the sample being introduced every month. The remainder of the sample, (about 15% of the total) which covers less settled areas of Australia and non-private dwellings, was rotated in fully for New South Wales, Victoria, Tasmania, Northern Territory and the Australian Capital Territory in September 1997, and for Queensland, South Australia, and Western Australia in October 1997.

Detailed information about the new sample can be found in *Information Paper: Labour Force Survey Sample Design* (cat.no 6269.0), which was released on 2 September 1997.

MIGRANTS IN THE AUSTRALIAN LABOUR FORCE

INTRODUCTION

In May 1997, migrants born in *main English speaking countries* (MESC) had a participation rate and an unemployment rate similar to those of Australian born persons. However, migrants born in *other than main English speaking countries* (OMESC) had a lower labour force participation rate and a higher unemployment rate than migrants born in MESC, substantially effecting the labour market outcomes of migrants as a whole. (For the purpose of this article the term "migrant" describes any person born outside Australia. Refer to the glossary of this publication for countries included in *main English speaking countries*).

Between May 1978 and May 1997 the number of migrants born in OMESC increased from 1,471,193 to 2,377,671, comprising 16.6% of the total civilian population aged 15 years and over in May 1997. In comparison, the number of migrants born in MESC increased from 1,167,411 to 1,485,256, and comprised 10.4% of the civilian population in May 1997.

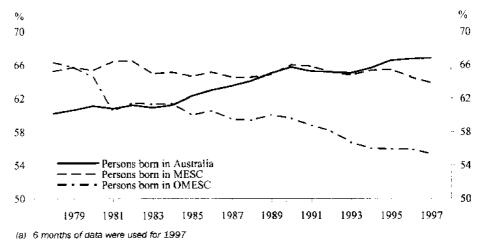

One of the key determinants of the labour market outcomes of migrants is fluency in the English language. Data from the *Labour Force Status and Other Characteristics of Migrants, November 1996** supplementary survey show that migrants born in OMESC who could speak English well or very well had a labour force participation rate of 74% and an unemployment rate of 9.3%. In comparison, those who could not speak English well, or at all, had a participation rate of 43% and an unemployment rate of 23.2%.

This article shows that a number of other factors contribute to differences in labour market outcomes between the two groups of migrants and Australian born persons. The factors considered in this article are sex, age, education, occupation and length of residence in Australia. However, it is important to note that other factors may also influence their labour market experiences. These include, for example, recognition of prior qualifications and the effects of immigration policy on the composition of the migrant population.

PARTICIPATION RATES

The annual average labour force participation rate of migrants born in MESC dropped slightly between 1978 and 1997, while the participation rate of Australian born persons increased strongly. In contrast, there has been a large decline in the participation rate of OMESC migrants since 1978 (from 66% to 55%). (See chart 1).

1 PARTICIPATION RATES OF MIGRANTS AND AUSTRALIAN BORN PERSONS, ANNUAL AVERAGES (1978-1997(a)).

Source: Labour Force Survey, unpublished data

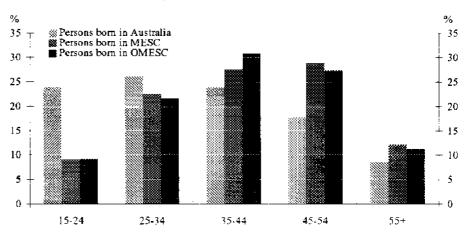

^{*} Data from the Labour Force Status and Other Characteristics of Migrants survey relate to persons who were not born in Australia, had arrived in Australia after 1970, were aged 18 years and over on arrival and had obtained permanent resident status.

When standardising for age (by holding the 1978 civilian age distribution constant over time), it was found that a substantial part of the fall in the participation rate of migrants born in OMESC between 1978 and 1997 was due to their changing age distribution. This was not the case for persons born in Australia or MESC, which had only slight differences between actual and standardised participation rates. Standardised participation rates for May 1997 were 66%, for both Australian born and migrants born in MESC, and 60% for migrants born in OMESC. This compared to their actual values of 66%, 65% and 55%, respectively.

Age distributions

In May 1997, half the Australian born labour force was aged under 35, compared to less than one third of migrants. Migrants tended to be older, with 40% of migrants aged 45 years and over compared to 25% of Australian born persons (see chart 2).

2 AGE DISTRIBUTION OF AUSTRALIAN BORN PERSONS AND MIGRANTS IN THE AUSTRALIAN LABOUR FORCE, MAY 1997.

Source: Labour Force Survey, unpublished data

When age was standardised, the May 1997 labour force participation rate of Australian born persons remained at 66%, while that of migrants born in MESC increased from 65% to 67% and that of migrants born in OMESC decreased from 55% to 54%.

Sex and age

Between 1978 and 1997 there was a large decrease in the participation rate of migrants born in OMESC. The participation rate of males born in OMESC declined by almost 20 percentage points between 1978 and 1997. The fall was most apparent for those aged 55 years and over. Although males born in Australia and MESC also experienced a decrease in participation rate during this period, it was less pronounced (2.7 and 6.1 percentage points respectively).

The participation rate of females born in OMESC decreased slightly between 1978 and 1997, contributing to the overall reduction in participation of OMESC born migrants. In contrast, females born in Australia and MESC experienced a considerable increase in participation rates.

Decreases of approximately 30 percentage points in participation rates were experienced by 15-19 year olds born in OMESC. However, participation rates for 15-19 year olds born in Australia and MESC remained relatively unchanged between 1978 and 1997.

Length of residence

For migrants born in MESC, those arriving prior to 1971 had the lowest participation rate in May 1997. The participation rate was highest for those arriving between 1991 and 1996. On the other hand, the participation rate of OMESC born migrants was highest for arrivals between 1971 and 1980 and was lowest for those arriving in Australia between January 1996 and May 1997 (see table 3).

3 PARTICIPATION RATES OF MIGRANTS BY PERIOD OF ARRIVAL, MAY 1997.

• • • • • • • • • • • • • • • • • • • •	Participation Rate %						
	Region of Birth						
Period of Arrival	MESC	OMESC					
Before 1971	52.6	44.4					
1971 - 1980	76.3	67.3					
1981 - 1990	74. 1	67.0					
1991 - 1995	79.9	50.0					
1996 - May 1997	70.4	36.3					
Source: Labour Force Survey, unpublished data							

In May 1997, migrants born in MESC and OMESC, who were aged over 54 and arrived prior to 1971 had a participation rate of 22% and 20% respectively. In comparison, participation rates for those aged less than 55 who arrived in this period, were mostly around 80%. For other periods of arrival, persons aged over 54 also had lower participation rates than all other age groups. However, the effect on the overall rate was not as strong since these people made up a relatively small proportion of the population compared to those arriving before 1971.

Education

According to data from the *Transition from Education to Work Survey* conducted in May 1996, 53% of migrants born in MESC had post school qualifications, compared to 44% of Australian born persons and 43% of migrants born in OMESC. At this time, persons born in Australia and MESC with post school qualifications had similar participation rates, while those born in OMESC had a participation rate almost 10 percentage points lower.

Low recognition of post school qualifications among migrants born in OMESC, compared to persons born in Australia or MESC, may have contributed to the group's lower participation rate. Data from the *Labour Force Status and Other Characteristics of Migrants* (November 1996) survey show that 72% of migrants born in MESC with post school qualifications, had a qualification which was recognised in Australia compared to only 43% of those born in OMESC. The participation rate for those who held a recognised post school qualification was 87% for both migrant groups. In contrast, participation rates for MESC and OMESC migrants who had post school qualifications which were not recognised in Australia, were 72% and 68% respectively.

For those without post school qualifications, OMESC born migrants had a participation rate 30 percentage points and 26 percentage points lower than Australian born persons and MESC born migrants, respectively.

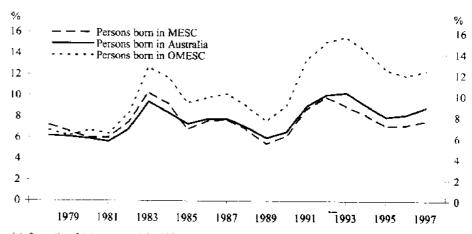

UNEMPLOYMENT RATES

Migrants made up more than a quarter of all unemployed persons in May 1997, with two thirds of these born in OMESC. In May 1997, migrants born in OMESC had an unemployment rate of 11.4%, 3.1 percentage points higher than the rate for Australian born persons. In contrast, the unemployment rate of migrants born in MESC was 0.9 percentage points lower than Australian born persons. Applying the age distribution of the May 1997 Australian labour force population to all three groups showed only a small impact on their comparative unemployment rates. Age standardised

unemployment rates were 7.8%, 8.8% and 13.6% for Australian born persons, migrants born in MESC and migrants born in OMESC, respectively.

Chart 4 shows that the differences between unemployment rates of those born in OMESC and the other two groups has been increasing since 1978, when they were all within one percentage point of each other. Standardising for age showed that the changing age distribution of each groups' civilian population between 1978 and 1997 did not significantly affect the unemployment rate of the three groups.

4 UNEMPLOYMENT RATES FOR MIGRANTS AND AUSTRALIAN BORN PERSONS, ANNUAL AVERAGES (1978-1997(a)).

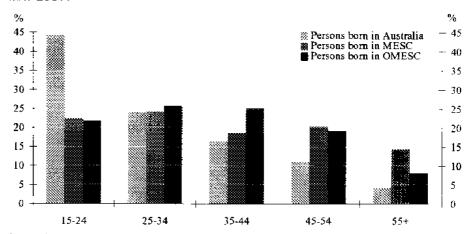

(a) 6 months of data were used for 1997 Source: Labour Force Survey, unpublished data

Chart 4 also shows increases in unemployment rates during periods of economic slowdown between 1981 and 1983. Between 1990 and 1993, the unemployment rate of migrants born in OMESC increased more rapidly than that of migrants born in MESC and Australian born persons during both these periods. After each period, the differential between the unemployment rate of OMESC migrants and the rates for the other two groups remained greater than it had been prior to the recessionary period.

Age distribution

In May 1997, of all unemployed persons who were born in Australia, the proportion unemployed decreased with age (see Chart 5). This was not the case for either migrant group. In fact, almost 45% of Australian born unemployed persons were aged 15-24 years, approximately twice the proportion in each migrant group.

5 AGE DISTRIBUTION OF UNEMPLOYED AUSTRALIAN BORN PERSONS AND MIGRANTS, MAY 1997.

Source: Labour Force Survey, unpublished data

Sex and age

Between 1978 and 1997 the unemployment rates of males and females in all three groups followed similar trends. Since the early 1980's, unemployment rates of migrants born in OMESC have remained consistently above those of the other two groups for most age groups, in both sexes. This was not the case for males aged 55-64, where the unemployment rates for both migrant groups were similar and well above the unemployment rate of those born in Australia.

During the last period of economic slowdown, the unemployment rates of migrants born in OMESC rose strongly across all age groups in both genders. However, the unemployment rates of females born in Australia or MESC in some age groups appeared to have been significantly less affected by the economic slowdown than the unemployment rates of males.

Length of residence

Language skills and cultural differences can have a large impact on the chance of employment. For migrants born in OMESC, longer length of residence allows for greater integration into Australian society and for English language skill development. Migrants born in MESC are less likely than OMESC born migrants to come from cultures vastly different to that of Australia's and, in general, find it easier to integrate into the Australian labour market.

Length of residence in Australia had a significant impact on unemployment rates of OMESC born migrants. Table 6 shows that the longer migrants born in OMESC had been in Australia, the lower their unemployment rate. In contrast, unemployment rates for MESC born migrants were fairly consistent for all periods of arrival in Australia beyond a relatively short time after arrival.

6 UNEMPLOYMENT RATES BY PERIOD OF ARRIVAL, MAY 1997.

1991 - 1995	6.4	19.8					
1996 - May 1997	17.3	30.7					
Source: Labour Force Survey, unpublished data							

Education

Almost 60% of migrant labour force participants born in MESC had a post school qualification in May 1996. In comparison, approximately 50% of Australian born participants and those born in OMESC had a post school qualification. Of persons with post school qualifications, those born in OMESC had a substantially higher unemployment rate (8.3%) than both MESC born (5.0%) and Australian born (4.8%). (See Table 7).

OMESC born migrants also had the highest unemployment rate for persons without post school qualifications. In comparison, Australian born persons and migrants born in MESC had similar unemployment rates for those with and without post school qualifications. Migrants born in OMESC and Australian born persons had similar proportions of their labour force participants with post school qualifications, yet OMESC born migrants had a higher unemployment rate.

In November 1996, migrants born in MESC had an unemployment rate of 4.8% for persons who held a *recognised* post school qualification and 8.4%

for those who had a post school qualification that was not recognised. For migrants born in OMESC, the unemployment rate was 8.4% for those whose qualification was recognised, and 12.3% for those who had a qualification that was not recognised.

7 UNEMPLOYMENT RATES FOR MIGRANTS AND AUSTRALIAN BORN PERSONS BY EDUCATIONAL ATTAINMENT, MAY 1996.

Unemployment rate (%)							
Persons born in Australia	Persons born in MESC	Persons born in OMESC					
4.8	5.0	8.3					
10.2	9.9	14.9					
	Persons bom in Australia 4.8	Persons born Persons born in Australia in MESC 4.8 5.0					

EMPLOYMENT

Education & Occupation

Jobs are sometimes referred to as 'blue collar' or 'white collar' depending on whether they involve manual work. In this article Plant and Machine Operators, and Drivers; Labourers and Related Workers; and Tradespersons are classified as 'blue collar'. All other occupation groups are classified as 'white collar'.

Compared to Australian born persons and migrants born in MESC, a greater proportion of migrants born in OMESC were working in blue collar occupations, regardless of whether they had a post school qualification. Australian born persons and migrants born in MESC without post school qualifications were 10 percentage points less likely to work in white collar occupations than those with post school qualifications. However, as shown in table 8, this difference was much greater (20 percentage points) for OMESC born migrants.

8 PROPORTION OF EMPLOYED AUSTRALIAN BORN PERSONS AND MIGRANTS IN WHITE & BLUE COLLAR OCCUPATIONS BY EDUCATIONAL ATTAINMENT, MAY 1996.

Type of	Proportion (%)										
	With post	school qual	ification	Without pos	Without post school qualification						
	Re	gion of Birth		Region of Birth							
Occupation	Australia	MESC	OMESC	Australia	MESC	OMESO					
White collar	69.9	71.4	65.8	59.9	61.7	44.6					
Blue collar	30.1	28.6	34.2	40.1	38.3	55.4					

Occupation

In 1989, 37% of migrants born in MESC and persons born in Australia worked in blue collar occupations compared to over 52% of migrants born in OMESC. Over the last period of economic slowdown, the total number of people employed in blue collar occupations decreased by 7.7%, yet for white collar occupations there was an increase of 3.5%. A majority of OMESC born blue collar workers were employed as 'Labourers and Related Workers' and 'Tradespersons'. The effect of the decline in employment in these occupations was greater for OMESC born migrants than migrants born in MESC and Australian born persons. The number of persons employed as 'Plant and Machine Operators, and Drivers', decreased relatively rapidly for

OMESC born migrants compared to Australian born persons, but shared this rapid decrease with migrants born in MESC (see Chart 9).

9 CHANGE IN THE NUMBER OF JOBS IN BLUE COLLAR OCCUPATIONS BETWEEN 1989 & 1993.

	Change in the number of jobs (%)							
Blue collar occupations	Persons born in Australia	Persons born in MESC	Persons born in OMESC					
Labourers and related workers	-5.4	-8.6	-11.3					
Tradespersons	-5.1	-9.8	-18.7					
Plant & machine operators, & drivers	-5.5	-16.5	-15.2					
Source: Labour Force Survey, unpublished dat	a							

The total number of persons employed in blue collar occupations has risen since the 'trough' in 1992/1993. However, the "recovery" in the number of blue collar jobs occupied by migrants born in OMESC has so far been weaker than those of the other two groups.

CONCLUSION

Between 1978 and 1997, the change in the labour market outcomes of migrants born in MESC was similar to that of Australian born persons. In contrast, migrants born in OMESC performed quite differently. During this period, OMESC born migrants experienced a relatively large decrease in their labour force participation rate and a relatively large increase in their unemployment rate, when compared to the other two groups. The decrease in participation rate was partially due to a change in the age distribution of the population of migrants born in OMESC over the 20 year period. During two periods of economic slowdown, the labour force participation of migrants born in MESC remained relatively stable and unemployment rates did not increase to the same extent as for OMESC born migrants.

Migrants born in OMESC had higher unemployment rates and were more likely to be employed in blue collar occupations than persons born in Australia and MESC. Migrants born in OMESC were also more strongly affected than the other groups by the decline in blue collar employment associated with the economic downturn of the early 1990s.

Low recognition of post school qualifications among OMESC born migrants, compared to migrants born in MESC, may have contributed to their labour market outcomes. Migrants born in OMESC had a lower participation rate and higher unemployment rate for persons with post school qualifications compared to those born in Australia and MESC, who had similar rates. Length of residence in Australia also appeared to have a stronger effect on the labour market performance of migrants born in OMESC than for MESC born migrants.

FURTHER INFORMATION

For further information on this and other labour related topics, contact Donna Maurer on Canberra (02) 6252 6525, or any ABS office.

LABOUR MARKET IN BRIEF

TREND ESTIMATES

After a small decline between February and May 1997, the trend estimate of employment has risen to 8,434,000 in October 1997. Full-time employment has been rising since May 1997 and part-time employment has been rising slowly since July 1997. The trend estimate of unemployment fell slightly to 784,300, while the unemployment rate fell to 8.5%. The trend estimate of the participation rate fell to 63.0%, with the male and female rates falling slightly to 72.9% and 53.4% respectively.

EMPLOYMENT

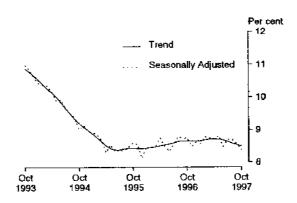

In October 1997, the seasonally adjusted estimate of employment remained steady at 8,450,400. Full-time employment fell by 9,900 to 6,294,600, offset by a rise in part-time employment of 9,700 to 2,155,800. Male employment rose by 13,200 to 4,803,400, while female employment declined by 13,500 to 3,647,000.

UNEMPLOYMENT

The seasonally adjusted estimate of unemployment fell by 18,800 to 772,700 in October 1997. The number of unemployed persons seeking full-time work fell by 10,200 to 610,000 and the number seeking part-time work fell by 8,600 to 162,700. The number of unemployed males fell by 20,400 to 450,400, while a small rise was recorded in female unemployment.

UNEMPLOYMENT RATE

The October 1997 seasonally adjusted unemployment rate fell by 0.2 percentage points to 8.4%. The male unemployment rate fell by 0.4 percentage points to 8.6%, while the female rate remained steady at 8.1%.

PARTICIPATION RATE

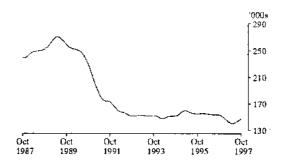

The seasonally adjusted estimate of the labour force participation rate fell by 0.2 percentage points to 63.0% in October 1997. Both the male and female rates fell by 0.2 percentage points, to 73.0% and 53.4%, respectively.

SELECTED LABOUR FORCE SERIES

MALES EMPLOYED FULL TIME: TREND SERIES

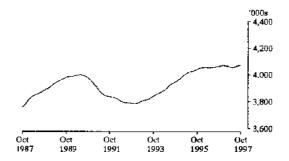

Males aged 15 to 19

The trend estimate of male junior full-time employment peaked at 271,300 in May 1989 before falling, sharply at first, to 147,500 in March 1994. The trend then rose slightly and was relatively stable for most of 1995 and 1996. After dropping to 141,500 in April 1997, the trend has risen in recent months, to 147,000 in October 1997.

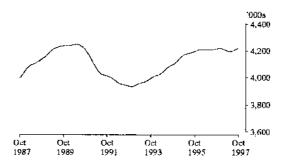

Males aged 20 and over

From a low of 3,784,400 in December 1992, the trend estimate of adult male full-time employment rose steadily at first, then more gradually, to 4,068,700 in January 1997. After falling slightly over the following four months, the trend estimate resumed rising, to 4,074,800 in October 1997.

All males

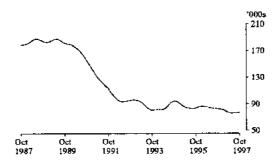

The trend estimate of male full-time employment fell to a low of 3,936,200 in November 1992, before rising steadily to 4,218,400 in December 1996. During the first half of 1997, the trend fell slightly, before again rising, to 4,221,800 in October 1997.

FEMALES EMPLOYED FULL TIME: TREND SERIES

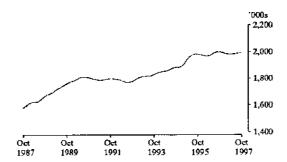

Females aged 15 to 19

The trend estimate of female junior full-time employment fell rapidly between July 1988 and October 1993. After a small period of growth in late 1994, the trend continued to fall slowly, and was 77,400 in October 1997.

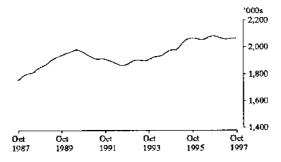

Females aged 20 and over

The trend estimate of female adult full-time employment gradually rose between August 1992 and September 1995 to 1,981,600. Following a small decline, the trend continued rising to reach 2,000,000 in October 1996. Since then, the trend estimate has remained relatively flat and was 1,990,700 in October 1997.

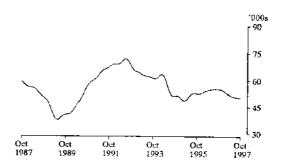

All females

From a low of 1,863,800 in August 1992, the trend estimate of the number of females employed full time rose to a high of 2,082,800 in October 1996. The trend then fell between late 1996 and May 1997 before again rising slowly, to 2,068,100 in October 1997.

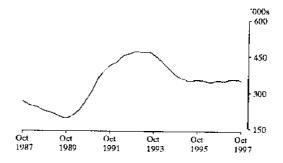

Males aged 15 to 19

The trend estimate of junior males looking for full-time work fell from 71,900 in July 1992 to 48,600 in March 1995. Gradually, the trend then began to rise reaching 55,300 in August 1996. Since then, the trend has fallen steadily to 50,500 in October 1997.

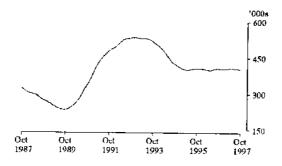

Males aged 20 and over

From a peak of 468,500 in January 1993, the trend estimate of adult males looking for full-time work fell to 349,100 in June 1995. The trend has remained relatively steady ever since, and was 350,700 in October 1997.

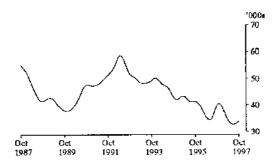

All males

The trend estimate of unemployed males looking for full-time work rose to 533,500 in December 1992, and remained at similar levels for the next year. The trend then began to fall, to 399,400 in May 1995. Since then, the trend has remained flat and stood at 401,200 in October 1997.

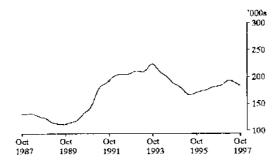

Females aged 15 to 19

From a peak of 58,800 in May 1992, the trend estimate of the number of junior females looking for full-time work fell relatively steadily to a low of 34,500 in June 1996. The trend estimate rose sharply in late 1996 before falling again. In recent months, the trend has risen and was 33,900 in October 1997.

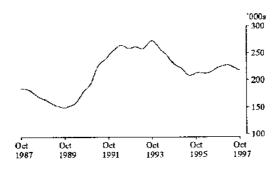

Females aged 20 and over

The trend estimate of adult females looking for full-time work rose to a high of 224,400 in October 1993, before falling sharply to 166,900 in June 1995. The trend then rose steadily to 193,800 in April 1997. It has since fallen to 184,000, in October 1997.

All females

From a peak of 273,800 in October 1993, the trend estimate of unemployed females looking for full-time work declined rapidly to 208,400 in July 1995. The trend then increased steadily to 228,400 in March 1997. In recent months, the trend has dropped to 217,900 in October 1997.

EXPLANATORY NOTES

INTRODUCTION

- 1 This publication contains estimates of the civilian labour force derived from the Labour Force Survey component of the Monthly Population Survey. Estimates of the labour force characteristics of family members and of family composition are also included.
- **2** Estimates of the civilian labour force are available for over 77 regions across Australia and are shown in various publications produced by State offices of the ABS. These data are also available on microfiche or as a special data service. For details, contact any ABS office.
- 3 Preliminary survey results are published in advance of this more detailed publication in *Labour Force*, Australia, Preliminary (6202.0).
- 4 Although emphasis in the population survey is placed on the regular collection of specific data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are available on request. A list of survey publications on labour force and related topics appears at the end of this publication.

POPULATION SURVEY

5 The population survey is based on a multi-stage area sample of private dwellings (currently about 30,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about 0.5% of the population of Australia. The information is obtained from the occupants of selected dwellings by specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the reference week).

INTRODUCTION OF TELEPHONE INTERVIEWING

- The ABS introduced the use of telephone interviewing into the Labour Force Survey over the period August 1996 to February 1997. Households selected for the Labour Force Survey are interviewed each month for eight months, with one-eighth of the sample being replaced each month. The first interview is conducted face-to-face. Subsequent interviews are then conducted by telephone (if acceptable to the respondent). The method was phased in by switching each incoming sample group over to telephone interviewing in its second month in the survey.
- 7 During the period of implementation, the new method produced different estimates than would have been obtained under the old methodology. The effect peaked in November 1996, when it is estimated that the published estimate of total employment was about 36,000 to 48,000 lower than would have been measured under the old methodology. The effect dissipated over the final months of implementation and was no longer discernible from February 1997. Therefore, the estimates for February 1997 and onwards are directly comparable to estimates for periods prior to August 1996.

SCOPE

- 8 The Labour Force Survey includes all persons aged 15 and over except:
- members of the permanent defence forces;
- certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- · overseas residents in Australia; and
- members of non-Australian defence forces (and their dependants) stationed in Australia.

From July 1993 Jervis Bay Territory has been excluded from the scope of the survey. Before July 1993 it was included in estimates for the Australian Capital Territory.

COVERAGE

- 9 In the Labour Force Survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The chance of a person being enumerated at two separate dwellings in the one survey is considered to be negligible. See paragraph 45 for information about the effect of the coverage rules on family statistics.
- 10 Persons who are away from their usual residence for six weeks or less at the time of interview are enumerated at their usual residence (relevant information may be obtained from other usual residents present at the time of the survey).

POPULATION BENCHMARKS

11 Labour Force Survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the usually resident population aged 15 and over by age and sex. This procedure compensates for under-enumeration in the survey, and leads to more reliable estimates. Persons who, at the time of interview, are overseas for more than six weeks but for less than 12 months are included in the independent population statistics (benchmarks) and are thus provided for in the calculation of the estimates. The benchmarks are the latest available estimates at the time the Labour Force Survey is conducted, but they usually differ from the official population estimates subsequently published in Australian Demographic Statistics (3101.0) because they are derived from incomplete information about population changes.

REVISION OF POPULATION BENCHMARKS

- 12 Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each Census of Population and Housing, and when population estimation bases are reviewed. These revisions affect original, seasonally adjusted and trend estimates. The last such revision was made in February 1994 to take account of the results of the 1991 Census of Population and Housing, which affected all the monthly estimates from January 1989 to January 1994.
- 13 Population benchmarks used in the estimation of Labour Force Survey data are compiled according to place of usual residence. For an explanation

of the conceptual basis of population estimates, see Information Paper: Population Estimates: An Outline of The New Conceptual Basis of ABS Population Estimates (3216.0). Prior to October 1982, labour force estimates were based on a combination of place of enumeration and place of usual residence.

HISTORY OF THE SURVEY

14 National surveys were conducted in February, May, August and November each year from 1964 to February 1978. The survey has been conducted on a monthly basis since February 1978.

QUESTIONNAIRE CHANGES

15 The questionnaire used in the survey for the collection of labour force data has been revised from time to time, the latest occasion being for the April 1986 survey. Details of these changes have been published in Information Paper: Questionnaires Used in the Labour Force Survey (6232.0) in March 1978, December 1981, August 1984, June 1986, June 1991 and March 1993.

FAMILY WORKERS

- INCLUSION OF CONTRIBUTING 16 In April 1986, the questionnaire was revised following the extension of the definition of employed persons to include persons who worked without pay between 1-14 hours per week in a family business or on a farm (i.e. contributing family workers). This definition aligned the Australian labour force concepts with the set of definitions adopted by the 13th International Conference of Labour Statisticians in October 1982.
 - 17 Previously, contributing family workers who worked 1-14 hours, or who had such a job but were not at work, were defined as either unemployed or not in the labour force, depending on whether they were actively looking for work. In order to assist users to assess the impact of the change, estimates for March 1986 based on the new definition were shown in footnotes to tables 1 and 2 of the February, March and April 1987 issues of this publication.
 - 18 A revised procedure for weighting families estimates, as presented in this publication, was also introduced in April 1986. Additional tables were included in the April 1986 issue of this publication to show the impact of this new procedure. Paragraph 50 contains more details.

COMPARABILITY OF SERIES

- 19 As noted in paragraph 12, estimates from January 1989 were revised to conform to revised population estimates following the 1991 Census of Population and Housing, and are thus not strictly comparable with estimates for periods prior to January 1989. An examination of the revised estimates showed that the effects on Labour Force Survey estimates for the period before January 1989 were inconsequential, and that no meaningful purpose would be served by publishing revised estimates for that period.
- 20 Comparability with estimates produced from the quarterly Wage and Salary Earners Survey is affected by the use of a different survey methodology and definitions. The Labour Force Survey provides estimates of people in jobs whereas the Wage and Salary Earners Survey provides an estimate of the number of jobs held by wage and salary earners. A more

detailed description of the differences between these two series is available on request.

21 From December 1989 onwards, the category 'other families' was split into 'one-parent families' and 'other families'. Therefore estimates of other families were not strictly comparable with estimates in previous issues. However, in November 1989, 97% of other families with dependants were one-parent families. In March 1994, a new families classification was introduced which also affected comparability (see paragraphs 47 to 49).

SURVEY SAMPLE REDESIGN

- 22 Following each Population Consus, the ABS reselects the Labour Force Survey sample to take into account the new information which is obtained from the Census. The sample that was used in the Labour Force Survey from September 1992 to August 1997 is being gradually replaced by a new sample selected using information collected in the 1996 Census. The new sample is being phased in over the period September 1997 to April 1998. For additional information, see Information Paper: Labour Force Survey Sample Design (6269.0).
- 23 The sampling fractions for each State/Territory differ in order to yield reliable estimates of the main labour force aggregates for each State and Territory. The sampling fractions for the new sample together with the sampling fractions determined from the 1991 Census are:

	1991 Census redesign	1996 Census redesign
New South Wales	1 in 277	1 in 300
Victoria	1 in 242	1 in 257
Queensland	1 in 19 5	1 in 222
South Australia	1 in 139	1 in 147
Western Australia	1 in 146	1 in 160
Tasmania	1 in 75	1 in 83
Northern Territory	1 in 75	1 in 85
Australian Capital Territory	1 in 75	1 in 85

RELIABILITY OF THE **ESTIMATES**

- 24 Estimates in this publication are subject to two sources of error:
- sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical Notes; and
- non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in coding and processing data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

DIFFERENCES BETWEEN CENSUS AND LABOUR FORCE SURVEY ESTIMATES

- 25 The results of the 1991 Census of Population and Housing show that labour force estimates derived from the Census differ from those derived from the Labour Force Survey.
- 26 The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the Census and the survey. It should be noted, however, that census estimates of unemployment do not take into account the 'available for work' criterion.
- 27 There are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include under-enumeration in the Population Census for which census labour force estimates have not been adjusted, the use in the Labour Force Survey of population benchmarks derived from incomplete information about population change (see paragraph 11), the inclusion of permanent defence forces in census estimates, the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules, differing questions used to determine labour force characteristics (particularly the identification of unemployed persons) and differing methods of adjustment for non-response to the survey or Census.
- 28 The Labour Force Survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and regions, whereas the Census of Population and Housing provides counts for small areas but in less detail than is available from the survey.
- 29 These considerations should be borne in mind when comparisons are made between Population Census and Labour Force Survey estimates.

SEASONAL ADJUSTMENT

30 Seasonally adjusted series are published in tables 2, 8 and 26. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be recognised more clearly. Seasonal adjustment does not remove the irregular or non-seasonal influences which may be present in any particular month. This means that month-to-month movements of the seasonally adjusted estimates may not be reliable indicators of trend behaviour. For example, irregular factors unrelated to the trend account for more than half the seasonally adjusted movement in series at the Australia level, with the following frequency:

Series	Monthly movements
Employment	5 in 10
Unemployment	7 in 10
Unemployment rate	7 in 10
Participation rate	9 in 10

31 The seasonal factors for all seasonally adjusted series are reviewed annually to take account of each additional year's original data. The latest review, in February 1997, revised the Australian and State seasonally adjusted and trend monthly series back to February 1978. For information

about the method of adjustment, please refer to the feature article in the February 1997 issue of this publication. Revised seasonally adjusted and trend estimates for all months for Australia and the States are available on request. Inquiries concerning this data should be directed to Donna Maurer on Canberra 02 6252 6525.

TREND ESTIMATION

- 32 Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The monthly trend estimates are derived by applying a 13-term Henderson-weighted moving average to all months except the last six. The last six monthly trend estimates are obtained by applying surrogates of the Henderson average to the seasonally adjusted series. Quarterly trend estimates (e.g. employment by industry) are derived by applying a 7-term Henderson moving average to the seasonally adjusted series. The 7-term Henderson average also uses surrogate forms of the average as the end of a time series is approached. Unlike the surrogate weights of the 13-term Henderson used on monthly data, the weights employed here are tailored to suit the particular characteristics of individual series. These trend series are used to analyse the underlying behaviour of the series over time. Trend series graphs are shown on pages 9 to 13 with the trend series published in tables 3, 9 and 26. Data from February 1978 are available on the ABS on-line data dissemination service, PC Ausstats. The trend series of the participation rate for married females are based on smoothed population estimates.
- 33 While this smoothing technique enables estimates to be produced which include the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months or two quarters have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors mentioned above in paragraph 31.
- 34 Trend estimates for the Australian Capital Territory and the Northern Territory are published in table 9. Original estimates for the two Territories have shown, historically, a high degree of variability, which can lead to considerable revisions to the seasonally adjusted estimates after each annual seasonal factor re-analysis. Seasonally adjusted estimates are not currently published for the two Territories. The most recent six months trend estimates are subject to revision. For the three most recent months, the revision may be relatively large. Inferences about trends drawn from smoothed seasonally adjusted (trend) estimates for months earlier than the latest three months are unlikely to be affected by month-to-month revisions. They may, however, be revised as a result of the annual re-analysis of seasonal factors.
- **35** Users may wish to refer to the ABS publication A Guide to Interpreting Time Series Monitoring 'Trends' an Overview (1348.0) for further information about trend estimates. Details of the trend weighting patterns are available on request from the Assistant Director, Time Series Analysis on Canberra 02 6252 6345.

MONTH-TO-MONTH MOVEMENTS

GROSS FLOWS

- 36 Care should be taken in the interpretation of month-to-month movements in these estimates. Survey estimates are subject to sampling and non-sampling variability as explained in paragraph 24.
- 37 In order to minimise respondent load and at the same time maintain continuity within the population survey sample, one-eighth of the dwellings are replaced after each survey. Adoption of this rotation procedure, whereby about seven-eighths of the sample remains unchanged from one month to the next, enables more reliable measurements of changes in the labour force characteristics of the population to be made than would be possible if a new sample were introduced each month.
- 38 Because a high proportion of private dwellings selected in one survey remains in the sample for the following survey, it is possible to match the characteristics of most of the persons in those dwellings from one month to the next, to record any changes that occur, and hence to produce estimates of flows between the different categories of the population and labour force.
- 39 The procedures used to select persons in non-private dwellings preclude the possibility of matching any of them who may be included in successive surveys. For this and other reasons, including the mobility of the population and non-response in either or both surveys, about 10% of persons in those dwellings which are included in the sample in successive months cannot be matched. The introduction of the new sample means less persons will be common between August, September and October 1997. Normally those who can be matched represent about 80% of all persons in the survey. For October 1997, about 76% of persons who were in the September survey could be matched.
- 40 Changes in the characteristics of this latter group are shown in the gross flows table (table 33). About two-thirds of the remaining (unmatched) 30% of persons in the survey are likely to have characteristics similar to those in the matched group, but the characteristics of the other third are likely to be somewhat different.
- **41** Gross flow estimates relate only to those persons in private dwellings for whom information was obtained in successive surveys. The expansion factors used in calculating the estimates were those applying to the second of each pair of months. Note that the estimates have not been adjusted to account for the unmatched sample component.
- 42 Although it is not possible to provide gross flow estimates for all persons in the survey it is considered that the estimates derived from matched records will be a useful guide to the proportions of the movements between categories which underlie the changes in monthly levels. When comparing flows for different periods it is important to take into account the population represented by the matched sample, as shown in the last line of the table.
- **43** While every effort is made to reduce non-sampling errors to a minimum, any such errors affecting labour force status will tend to

accumulate in the gross flow statistics rather than to cancel out. The estimates are also subject to sampling variability, as explained in the Technical Notes. For these reasons the estimates of flows should be used with caution. The standard errors may be obtained from table A of the Technical Notes.

LABOUR FORCE STATUS AND OTHER CHARACTERISTICS OF FAMILIES

- 44 As a part of survey procedures, family relationships are determined each month, enabling both the estimation of persons cross-classified by their relationship in the household and the estimation of families. This publication contains tables showing the labour force status and family status of individuals and families classified by family type, number of family members, the labour force status of persons within families, the number of children under 15 present and the number of dependants present.
- 45 Because of the coverage rules, persons who usually live with other members of their family may, at the time of the survey, be enumerated as not living with all the usual members of their family. This situation is more likely for persons who are enumerated as visitors to other private dwellings or as persons staying in non-private dwellings (hotels, hospitals, etc.). The determination of family structure and family characteristics in such cases is difficult.

Thus for survey questions used to determine family relationships, scope was further restricted to usual residents of private dwellings and the following persons were excluded:

- all persons enumerated in non-private dwellings (including hotels, motels, hospitals and other institutions); and
- persons enumerated as visitors to (rather than usual residents of) private dwellings.
- 46 In addition, in those households where it was not possible to obtain information relating to all the usual residents, no family information was recorded. Thus persons living in households which include a member of the permanent defence forces, who is outside the scope of the population survey, are excluded from survey questions used to determine family relationships because family information could not be obtained from each usual resident. Similarly households which, at the time of the survey, have one or more of their usual residents away for more than six weeks, are excluded from the family survey. This also applies to households from which an incomplete or inadequate questionnaire was obtained for any usual resident in on scope and coverage. A summary of those persons for whom family information is obtained as well as those usual residents of private dwellings for whom complete family information cannot be obtained, and those persons specifically excluded from the family determination procedures is contained in the family tables. Generally, relationship in household is determined for more than 90% of all civilians aged 15 and over.
- 47 Relationship in household and Family type classifications were introduced in the March 1994 issue of this publication to align with ABS

standards. Most categories in the two classifications remain comparable with categories in the previous classifications. The cases in which there are breaks in comparability are discussed in the following paragraphs.

48 Relationship in household. This classification was previously referred to as Family status.

- Lone parents (previously referred to as Sole parents) now includes
 parents with non-dependent children (provided those children are
 without a spouse or children of their own). These Lone parents without
 dependants are shown separately in table 35 and there were 205,800
 such persons in March 1994.
- Dependent students (previously Full-time students aged 15-24) now comprise sons or daughters (of a couple or a lone parent) aged 15-19 attending school or aged 15-24 attending a tertiary educational institution full time. Other related full-time students, who were also previously classified as Full-time students aged 15-24 are now included in Other family persons. There were 24,200 such persons in March 1994.
- Other family persons now comprises the previous groups Other family bead, excluding those now counted as Lone parents (79,200 persons in March 1994), the other related full-time students previously classified as Full-time students aged 15-24 (see above; 24,200 in March 1994) and Other relative of married couple or family bead (218,100 in March 1994).
- **49** Family type. This classification was previously referred to as Type of family. There are three types of families in the new classification, as follows:
- Couple families is the term used to describe families previously referred
 to as Married-couple families. Apart from the name change, the new
 category is otherwise exactly comparable with the old category.
- One-parent families now includes those families in which there is a lone parent with only non-dependent children present. Such families were previously included in Other families. There were 208,400 of these families in March 1994.
- Other families now excludes those families in which there is a lone parent with only non-dependent children present (see above).
- 50 Estimates of the number of families in this publication differ from those in publications prior to the April 1986 issue. This is due to the adoption of a weighting procedure where the weight for a family is determined using an average of the weights for all family members responding to the Labour Force Survey. Previously, the weight used to derive estimates of the number of families was determined by nomination of a proxy 'head of household' as representative of the family.
- **51** From April 1991, labour force birthplace data are aggregated according to major groups of the *Australian Standard Classification of Countries for Social Statistics (ASCCSS)* (1269.0). The ASCCSS was developed by the ABS

BIRTHPLACE

for use whenever demographic, labour and social statistics are classified by countries.

- 52 The ASCCSS major groups are based on the concept of geographic proximity. They differ from the country groups presented in this publication prior to April 1991. For example, African countries are now covered by 'The Middle East and North Africa' and 'Africa (excluding North Africa)', while Asia has been split into 'Southeast Asia', 'Northeast Asia' and 'Southern Asia'. Data for selected individual countries will continue to be available in this publication and comprehensively on microfiche.
- 53 From August 1994, Labour Force Survey industry data are classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC), a detailed description of which appears in ANZSIC 1993 (1292.0). Like the previous Australian Standard Industrial Classification (ASIC), ANZSIC classifies businesses according to their economic activities, in a structure consisting of 4 levels (Division, Subdivision, Group and Class). Labour Force Survey data are coded at the Group level, as was the practice under ASIC.
- 54 To enable the conversion of historical data from ASIC to ANZSIC for the period November 1984 to May 1994, a concordance was published in the August 1994 issue of this publication and in the Information Paper Labour Force Survey: Introduction of ANZSIC for Industry Data (Replacement Publication) (6259.0). It has been found that the concordance, which was based on preliminary investigations, did not provide the most appropriate conversion for certain Group level industries. An improved concordance has now been applied to historical Labour Force Survey estimates. This concordance was published in an appendix to the May 1996 issue of this publication, and in a further issue of the above Information Paper. For further information about the new concordance or the availability of data, contact Donna Maurer on Canberra 02 6252 6525.
- 55 From August 1996, Labour Force Survey occupation data are classified according to the Australian Standard Classification of Occupations (ASCO) Second Edition, a detailed description of which appears in ASCO—Australian Standard of Occupations, Information Paper (1221.0). The new version of the classification replaces ASCO First Edition, which was adopted in the survey in August 1986. Like the previous ASCO First Edition, ASCO Second Edition is a skill-based classification of occupation. However, the structure of ASCO Second Edition comprises five hierarchial levels (Major Group, Sub-Major Group, Minor Group, Unit Group and Occupation) compared with four levels in ASCO First Edition (Major Group, Minor Group, Unit Group and Occupation). Labour Force Survey data are coded to the Unit Group level, as was practice under ASCO First Edition.
- 56 Estimates for employed persons classified by industry, occupation and status in employment are available each February, May, August and November. For these months, the following tables are also published in this publication:

INDUSTRY

OCCUPATION

ADDITIONAL DATA

- Employed persons;
- Industry (original, seasonally adjusted and trend);
- Industry and occupation:
- Full-time and part-time workers;
- Status in employment;
- Age and birthplace;
- Hours worked;
- Industry Divisions and Subdivisions;
- Occupation Major and Minor groups;
- Industry by occupation;
- Unemployed persons; and
- Industry and occupation of last full-time job:
 - * Unemployment rate.

Seasonally adjusted estimates of employed persons by industry have been published in this bulletin since February 1993. Trend estimates have been published since August 1994.

TECHNICAL NOTES

A new sample for the Labour Force Survey is being phased in over the period September 1997 to April 1998. For information about the sample design see *Information Paper: Labour Force Survey Sample Design* (6269.0).

ESTIMATION PROCEDURE

The labour force estimates are derived from the population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

RELIABILITY OF THE ESTIMATES

Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the estimates that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the estimate that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.

The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding data, and errors made in processing the data. Inaccuracies of this kind are referred to as the non-sampling error and they may occur in any enumeration, whether it be a full count or a sample. It is not possible to quantify non-sampling error, but every effort is made to reduce it to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures. For the examples on pages 56 and 57 it is assumed to be zero. In practice, the potential for non-sampling error adds to the uncertainty of the estimates caused by sampling variability.

Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in table 1. Standard errors of other estimates and other monthly movements should be determined by using tables A and B.

The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger is the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

As the standard errors in table A show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, only estimates with relative standard errors of 25% or less, and percentages based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with larger relative standard errors have been included and are preceded by an asterisk (e.g. *3.4) to indicate they are subject to high standard errors and should be used with caution.

The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is given in table B. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in table B. Standard errors of quarterly movements can be obtained by multiplying the figures in table A by 1.11. Standard errors of all annual movements can be obtained by multiplying the figures in table A by 1.3. When using table A or table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

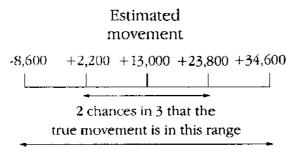

Examples of the calculation and use of standard errors are given below:

■ Consider an estimate for Australia of 500,000 employed persons aged 15–19. By referring to table A, in the row for an estimate of 500,000 and the column for Australia, a standard error of 9,000 is obtained. There are about two chances in three that the true value (the number that would have been obtained if the whole population had been included in the survey) is within the range 491,000 to 509,000. There are about nineteen chances in twenty that the true value is in the range 482,000 to 518,000.

Published estimate 482,000 491,000 500,000 509,000 518,000 2 chances in 3 that the true value is in this range

19 chances in 20 that the true value is in this range

■ Consider estimates for females employed part time in Australia of 1,387,000 in one month and 1,400,000 in the next month. This represents an upward movement of 13,000. By referring to table B for the larger estimate of 1,400,000, a movement standard error of 10,800 is obtained (after applying linear interpolation and rounding). Therefore, there are about two chances in three that the true movement is in the range +2,200 to +23,800 and about nineteen chances in twenty that the true movement is in the range -8,600 to +34,600.

19 chances in 20 that the true movement is in this range

The relative standard errors of estimates of aggregate bours worked, average bours worked, average duration of unemployment, and median duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see table A) and then multiplying the figure so obtained by the following relevant factors:

- aggregate hours worked: 1.2;
- average hours worked: 0.7;
- average duration of unemployment: 1.3; and
- median duration of unemployment: 2.0.

The levels at which these and other labour force estimates have a relative standard error of 25% are shown in table C.

The following is an example of the calculation of standard errors where the use of a factor is required.

Consider a median duration of unemployment for Australia of 30 weeks, with an estimate of 1,000,000 persons unemployed. Table A gives the standard error as 11,800 which is 1.2% as a relative standard error. The factor of 2.0 (see paragraph 10) is applied to the relative standard error of 1.2% to obtain 2.4%. Therefore the standard error for the median duration of unemployment is 2.4% of 30 weeks, i.e. about one week. So there are two chances in three that the median duration of unemployment is between 29 and 31 weeks, and about nineteen chances in twenty that it is between 28 and 32 weeks.

Proportions and percentages (for example, unemployment rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}$$

Standard errors contained in tables A and B are designed to provide an average standard error applicable for all monthly Labour Force Survey estimates. Analysis of the standard errors applicable to particular survey estimates has shown that the standard errors of estimates of employment are generally equivalent to those shown in tables-A and B, while standard errors for estimates of unemployment and persons not in the labour force are approximately 3% and 11%, respectively, higher than those shown in the tables. Standard errors for capital cities are approximately the same as those for corresponding States. Standard errors of estimates of numbers of families are approximately the same as those for numbers of persons. Standard errors of estimates of persons born in Australia are approximately the same as those shown in tables A and B. For aggregate estimates of persons born outside Australia the standard errors are about 14% higher. The standard errors vary for individual countries of birth, but are on average about 7% higher.

GLOSSARY

Actively looking for work

Includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

Aggregate hours worked

The total number of hours a group of employed persons has actually worked during the reference week, not necessarily hours paid for.

Attending school

Persons aged 15-19 who, during the reference week, were enrolled full time at secondary or high schools.

Attending tertiary educational institution full time

Persons aged 15-24 who, during the reference week, were enrolled full time at a TAFE college, university, or other tertiary educational institution.

Average duration of unemployment For a group of unemployed persons, the aggregate duration of unemployment divided by the number of persons in the group.

Average family size

For any group of families, the total number of family members divided by the number of families in the group.

Average hours worked

Aggregate hours worked by a group divided by the number of persons in that group.

Birthplace

From April 1991, classified according to the Australian Standard Classification of Countries for Social Statistics (ASCCSS) (1269.0).

Contributing family worker

A person who works without pay, in an economic enterprise operated by a related person living in the same household. (This category was formerly entitled unpaid family helper).

Couple families

Families in which there are two married persons and these persons are husband and wife.

Dependants

All family members under 15 years of age; all family members aged 15–19 attending school or aged 15–24 attending a tertiary educational institution full time (except those classified as husbands, wives or lone parents).

Dependent student

In couple or one-parent families, sons or daughters aged 15–19 attending school or aged 15–24 attending a tertiary educational institution full time (except those classified as husbands, wives or lone parents).

Duration of unemployment

The period from the time a person began looking for work or was stood down, to the end of the reference week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full time for two weeks or more to the end of the reference week.

Employed

Persons aged 15 and over who, during the reference week:

worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising employees, employers and own account workers); or

- worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers); or
- were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- were employers, own account workers or contributing family workers who had a job, business or farm, but were not at work.

Employee

A person who works for a public or private employer and receives remuneration in wages, salary, commission, tips, piece-rates or pay in kind, or in their own business, either with or without employees, if that business was incorporated. (This category was formerly entitled wage and salary earner).

Employer

A person who operates his or her own economic enterprise or engages independently in a profession or trade, and hires one or more employees, and the business was not incorporated.

Employment/population ratio

For any group, the number of employed persons expressed as a percentage of the civilian population aged 15 and over in the same group.

Family

Two or more related persons (*relationship* includes relationships by blood, marriage or adoption) usually resident in the same household at the time of the survey. A family comprises a married couple or a family head as defined, together with any persons having any of the following relationships to them:

- sons or daughters of any age, if not married and with no children of their own present;
- other relatives if not accompanied by a spouse, sons or daughters, or parents of their own; or
- any children under 15 years of age who do not have a parent present.

Family head

Any person without a spouse present:

- with a son or daughter aged under 15 present; or
- without a son or daughter aged under 15 present, but with a son or daughter aged 15 or over present (provided that the son or daughter has no spouse, son or daughter of his/her own present); or

Where a family has no person falling into either of these categories, the family head is generally defined to be the eldest person in the family.

No family head is determined for a couple family.

Former workers

Unemployed persons who have previously worked full time for two weeks or more but not in the past two years.

Full-time workers

Employed persons who usually worked 35 hours or more a week (in all jobs) and others who, although usually working less than 35 hours a week, worked 35 hours or more during the reference week.

Household

A group of one or more persons in a private dwelling who consider themselves to be separate from other persons (if any) in the dwelling, and who make regular provision to take meals separately from other persons, i.e. at different times or in different tooms. Lodgers who receive accommodation but not meals are treated as separate households. Boarders who receive both accommodation and meals are not treated as separate households. A household may consist of any number of families and non-family members.

Industry

From August 1994, classified according to the Australian and New Zealand Standard Industrial Classification (ANZSIC) 1993 (1292.0).

Job leavers

Unemployed persons who have worked full time for two weeks or more in the past two years and *left that job voluntarily*, that is, because of unsatisfactory work arrangements/pay/hours; the job was seasonal, temporary or a holiday job and they left that job to return to studies; their last job was running their own business and they closed down or sold that business for reasons other than financial difficulties; or any other reasons.

Job losers

Unemployed persons who have worked full time for two weeks or more in the past two years and *left that job involuntarily*, that is, were laid off or retrenched from that job; left that job because of their own ill-health or injury; the job was seasonal, temporary or a holiday job and they did not leave that job to return to studies; or their last job was running their own business and the business closed down because of financial difficulties.

Labour force

For any group, persons who were employed or unemployed, as defined.

Labour force status

A classification of the civilian population aged 15 and over into employed, unemployed or not in the labour force, as defined. The definitions conform closely to the international standard definitions adopted by the International Conferences of Labour Statisticians.

Lone parent

The head of a one-parent family.

Lone person

A person who is the sole member of a household.

Long-term unemployed

Persons unemployed for a period of 52 weeks or more.

Main English speaking countries

The United Kingdom, Ireland, South Africa, Canada, the United States of America and New Zealand.

Marital status

Persons are classified as married (husband and wife) if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not-married category comprises persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household.

Median duration of unemployment The duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median and the other, persons whose duration is below it.

Non-dependent child

In couple or one parent families, sons or daughters aged 15 and over, other than those classified as dependent students, husbands, wives or sole parents.

Non-family member

A person who is not related to any other member of the household in which they are living.

Not in the labour force

Persons who were not in the categories employed or unemployed, as defined. They include persons who were keeping house (unpaid), retired, voluntarily inactive, permanently unable to work, persons in institutions (hospitals, gaols, sanatoriums, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the reference week was jury service or unpaid voluntary work for a charitable organisation.

Occupation

From August 1996, classified according to the Australian Standard Classification of Occupations (ASCO) Second Edition 1996. See Information Paper: ASCO – Australian Standard Classification of Occupations (1221.0).

One-parent families

Families in which there is a family head together with at least one son or daughter of his/her own.

Other families

Families which are not couple families or one-parent families, as defined. They include families in which there is no parent, for example a family head living with a brother or sister.

Own-account worker

A person who operates his or her own economic enterprise or engages independently in a profession or trade, and hires no employees, and the business was not incorporated (this category was formerly entitled self employed).

Participation rate

For any group, the labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Participation rates for persons classified by birthplace are calculated using population estimates which exclude those in institutions. Participation rates for persons classified by school or tertiary educational institution attendance are calculated using population estimates which include those in institutions.

Part-time workers

Employed persons who usually worked less than 35 hours a week and who did so during the reference week.

Seasonally adjusted series

A time series of estimates with the estimated effects of normal seasonal variation removed. See paragraphs 30 and 31 of the Explanatory Notes for more detail.

State capital cities

The areas determining the six State capital cities are the Statistical Divisions for those capital cities defined in the Australian Standard Geographical Classification (ASGC) Manual, Edition 2.5 (1216.0).

Status in employment

Employed persons classified by whether they were employers, own account workers, employees, or contributing family workers.

Trend series

A smoothed seasonally adjusted series of estimates. See paragraphs 32 to 35 of the Explanatory Notes for more detail.

Unemployed

Persons aged 15 and over who were not employed during the reference week, and:

- had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:
- were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week); or
- were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or
- were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four

weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown.

Unemployed looking for first full-time job

Unemployed persons looking for full-time work who had never worked full time for two weeks or more.

Unemployed looking for first

Unemployed persons who had never worked full time for two weeks or more.

Unemployed looking for full-time work

Unemployed persons who actively looked for full-time work or were to resume a full-time job, from which they had been stood down.

Unemployed looking for part-time work Unemployed persons who had actively looked for part-time work only, or were to resume a part-time job, from which they had been stood down.

Unemployed persons classified by industry and occupation

Unemployed persons who had worked full time for two weeks or more in the last two years are classified according to the industry and occupation of their most recent full-time job.

Unemployment rate

For any group, the number of unemployed persons expressed as a percentage of the labour force in the same group.

SUPPLEMENTARY SURVEYS

The supplementary and special surveys collect data on particular aspects of the labour force. The following is an historical list of supplementary and special labour force surveys. The data is available in publication form, by subscription or on request. It may be possible to order unpublished data on the following supplementary and special surveys by contacting the ABS.
