## INQUIRIES

- for further information about statistics in this publication and the availability of related unpublished statistics, contact Daniel O'Dea on Canberra (02) 6252 6114.

# INTRODUCTION

*Australian Economic Indicators* presents a statistical summary of the Australian economy, and includes comprehensive tables and charts, as well as commentaries, occasional articles and technical notes. International comparisons of selected economic indicators are also provided. *Australian Economic Indicators* has been developed primarily as a reference document, providing a broad basis for economic analysis and research.

## The Statistics

The statistics are generally presented as time series for the last nine years of annual data, and for the last nine quarters or 15 months of data. To assist analysis most tables include percentage movements, as well as levels, of series.

For users requiring longer time series, a special issue of *Australian Economic Indicators* is produced at the beginning of each year. It contains, for most series, a greater span of annual, quarterly and monthly data. To accommodate these changes, each special issue has a graphical summary and no commentaries. Special issues were released for January 1992, January/February 1993, February 1994, February 1995, February 1996 and February 1997.

The tables contain mainly ABS data, although data from other sources are included. For ABS sourced data, the publication name and catalogue number are included in the footnotes of the tables. If the data are from other sources, the source organisation's name is included in the footnotes.

The statistics shown are the latest available as at 13 November 1997.

This issue of *Australian Economic Indicators* contains the following releases, articles and technical notes:

## Corrigendum

An error has been detected in Table 5.4, in the *Australian Economic Indicators* (AEI) publication (1350.0) from August 1996 to November 1997.

Table 5.4 in this issue (December 1997) is correct.

In the August 1996 to November 1997 issues, incorrect data was shown for the Annual Average (1989–90 = 100.0) part of Table 5.4: Fixed-Weighted Price Indexes: Components of Expenditure on Gross Domestic Product.

These data published in the source publication, *Australian National Accounts: National Income, Expenditure and Product* (5206.0), are correct.

## UPCOMING ABS RELEASE

*Don't just go with the flow, take stock of Australia's assets with:*

### **Australian National Accounts: National Balance Sheet – 30 June 1996**

**(ABS Catalogue no. 5241.0), due for release in the near future**

The 30 June 1996 balance sheet includes the latest estimates of the following —

Australia's net worth including estimates for each of Australia's institutional sectors:

- households and unincorporated enterprises;
- general government;
- financial enterprises; and
- non-financial corporations.

Value of produced assets, by asset type, by sector:

- dwellings;
- non-dwelling construction;
- machinery and equipment;
- livestock;
- real estate transfer expenses; and
- inventories (including forest plantations).

Values and physical quantities of some of Australia's non-produced assets:

- land (by State);
- sub-soil assets;
- native forests (by State).
- financial assets and liabilities:
  - Australia's financial assets with, and to, the rest of the world; and
  - financial assets and liabilities by institutional sector.

Commentary and explanatory notes are provided along with time series data from 1989–96 (longer for some natural resources).

For further information on *Australian National Accounts: National Balance Sheet – 30 June 1996 (5241.0)*, contact Sean Thompson (National Accounts Research Section, ABS) on telephone (02) 6252 7121.

# NEWS RELEASE

## CHANGES COMING FOR THE CONSUMER PRICE INDEX

Following is the ABS news release of 12 November 1997, announcing important changes to the Consumer Price Index.

The Australian Statistician, Bill McLennan, announced today (Wednesday 12 November 1997) that the Consumer Price Index (CPI) will be changed from September quarter 1998, to provide a general measure of price inflation for the household sector.

As a result, the major changes are that all households will be covered by the new CPI, owner-occupier housing costs will be represented by new dwelling purchases (excluding land) and interest rates will be excluded from the index.

The changes follow extensive public consultation over the past six months as part of the latest periodic review of the CPI.

'The decisions which have been taken represent an on-balance view of what sort of CPI is best suited to meet the varying requirements of the Australian community now and into the next century', Mr McLennan said.

'Historically, the CPI was designed as a measure of changing living costs of wage and salary earner households. The CPI was a key input into centralised wage setting processes.'

'Our consultation has shown that the CPI is now increasingly seen as a measure of price change for the household sector as a whole.'

The Statistician said other changes will also be made to the CPI. One such change is the inclusion of some

new items in the CPI 'basket' reflecting changes in consumption patterns since the previous CPI review.

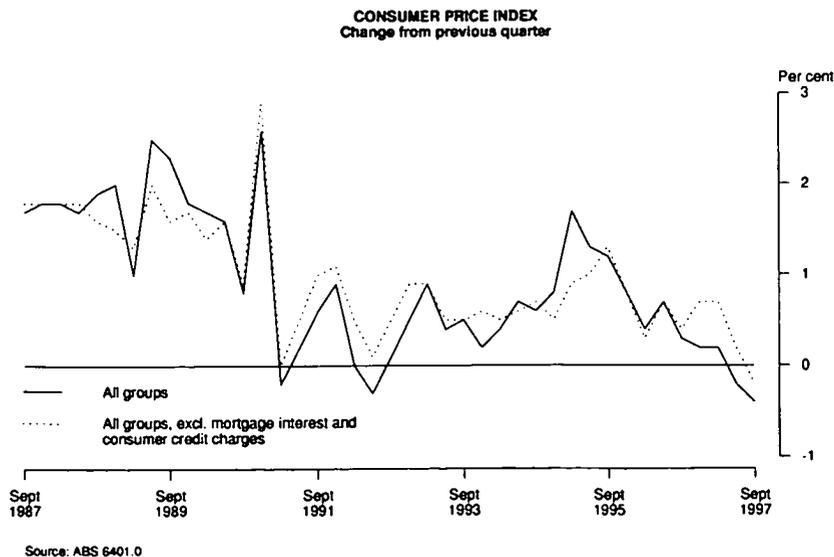

'I thank all those people who made submissions to the CPI review and to members of the CPI Review Advisory Group who assisted in drawing together user views', Mr McLennan said.

A further information paper will be released in September 1998, prior to the release of the September quarter 1998 CPI, which will provide details of the final composition of the 13th series CPI.

The Statistician's decisions on the CPI review are outlined in *Information Paper: Outcome of the 13th Series Australian Consumer Price Index* (Cat. no. 6453.0), available from ABS Bookshops and the ABS internet site [http:// www.abs.gov.au](http://www.abs.gov.au).

### Key Changes to the 13th series Australian CPI

The 13th series CPI will be specifically designed to provide a general measure of price inflation for the household sector as a whole. Accordingly, the ABS will adopt the acquisitions approach for the construction of the index (see the note 'Conceptual approaches to the construction of consumer price indexes' at the end of this news release) and utilise a weighting pattern representative of all private households in the eight capital cities. The most noticeable changes from the current CPI will be the exclusion of mortgage interest and consumer credit charges from the index and the inclusion of net expenditure on new dwellings (excluding land). The **Graph** below shows the current All groups CPI (the so called 'headline' CPI) and the CPI excluding mortgage interest and consumer credit charges.

The population coverage of the CPI will be expanded from the current restriction to wage and salary earner households to cover all private households in the eight capital cities. This will result in the population coverage increasing from 29% to 64% of Australian private households.

The CPI will continue to be compiled and published quarterly.

A ninth major commodity group, Financial services, will be incorporated into the index, comprising specific fees and charges paid in respect of financial services together with the cost of financial intermediation services.

Home computers and software, tertiary education fees and domestic services will be added to the index, but gambling will continue to be excluded.

The Selected State and local government charges index and the index of imported items will be dropped. Both indexes will be replaced by more appropriate indexes to be developed in consultation with users. State and local government charges and imported items will continue to be included in the CPI.

In light of the decision to change the design of the CPI to provide a better measure of price inflation for the household sector as a whole, the ABS will review the allocation of the CPI price sample across the capital cities with a view to optimising the national estimate. This work will be undertaken as resources permit and will involve further consultation with key stakeholders.

The ABS will proceed to develop a measure of underlying inflation for the household sector in accordance with the proposals contained in *Information Paper: An Analytical Framework for Price Indexes in Australia* (Cat. no. 6421.0). The most significant characteristic of this measure is that it will net out the effects of changes in indirect taxes.

The ABS will also develop analytical indexes specifically designed to measure changes in the cost of living of subgroups in the population. These indexes will be constructed on an outlays basis and will be published at approximately annual intervals.

The ABS will introduce the facility to compile spatial comparisons of price levels in the eight capital cities as resources permit.

The 13th series CPI will be introduced in the September quarter 1998 and will be linked to the 12th series CPI at the June quarter 1998.

#### **Endnote: Conceptual approaches to the construction of consumer price indexes**

The Fourteenth International Conference of Labour Statisticians, convened by the Governing Body of the

International Labour Organisation (ILO) in 1987, adopted a *Resolution concerning consumer price indexes* (ILO resolution) which includes the following statement:

'The purpose of a consumer price index is to measure changes over time in the general level of prices of goods and services that a reference population acquire, use or pay for consumption.'

The phrase 'goods and services that a reference population acquire, use or pay for consumption' (emphasis added) recognises that there are essentially three conceptually valid approaches to CPI compilation:

- the *acquisitions* approach, which defines the CPI 'basket' as consisting of all those consumer goods and services actually acquired by households during the base period;
- the cost of *use* approach, which defines the CPI 'basket' as consisting of all those consumer goods and services actually consumed (or used up) in the base period irrespective of when they were acquired or paid for; and
- the actual outlays (or *payments*) approach which defines the CPI 'basket' in terms of the actual amounts paid (or outlaid) by households during the base period to gain access to consumer goods and services (without regard to the source of the funds).

There is no international standard approach which is recommended for adoption by countries. Therefore countries have adopted different approaches which they believe best suit their principal uses.

The acquisition and outlays approaches result in very similar baskets. In fact the acquisitions basket can be viewed as a subset of the outlays basket. Both approaches include all those goods and services acquired during the base period, while the outlays approach also includes payments which are not directly related to the acquisition of specific goods and services but represent inescapable costs of acquisition or consumption. Examples are local government property rates and interest charges. Interest charges are incurred by those households that have financed purchases by borrowings. The total amount of interest charges incurred in any period typically bears no direct relationship to the actual quantities of specific goods and services acquired by households during the period. As such, interest charges are not included in an acquisitions index.

# Are Recent Labour Force Estimates Really More Volatile?

Cynthia Kim

## Introduction

Large monthly movements in employment and unemployment have from time to time attracted the attention of some commentators and labour market analysts, raising the question of whether the volatility of the series has increased in recent years. This article shows that the seasonally adjusted estimates derived from the monthly Labour Force Survey (LFS) have not increased their volatility in recent times.

## The volatility in the seasonally adjusted estimates at first glance

A time series can generally be decomposed into three broad components: the seasonal, the irregular, and the trend components. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. However, seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present in any particular period. This means that the seasonally adjusted series can often show volatile month-to-month movements, and these movements may not be reliable indicators of the underlying trend behaviour of the series.

Graphs 1 and 2 show the monthly percentage movements in the seasonally adjusted estimates of persons employed and unemployed, respectively. Inspection of the graphs shows that both series have displayed volatile monthly movements. However, neither series has become appreciably more volatile

in the recent years. The information from these graphs provide a first impression of the volatility of the series, but the measure of volatility can be further refined.

## A more precise measure of volatility

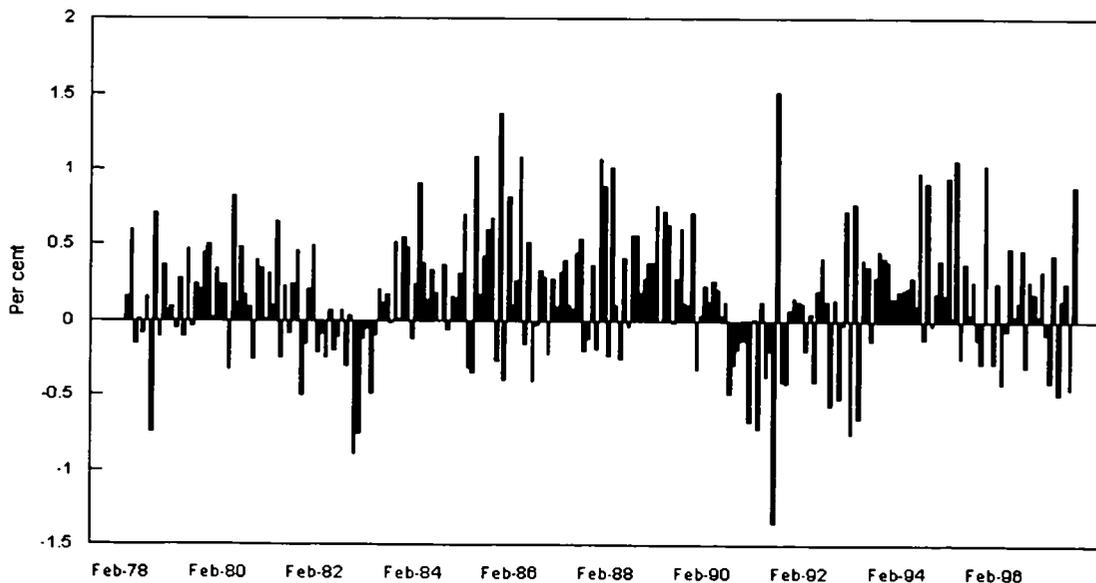

A more precise measure of volatility can be obtained by examining the irregular component in the seasonally adjusted estimates, which can be easily derived using the published data. The irregular component can be obtained by subtracting the trend estimate from the seasonally adjusted, i.e. Irregular (I) = Seasonally Adjusted (SA) - Trend (T). This gives a simple estimate of the irregular component of the series, which is expressed as thousands of persons.

Alternatively, we can express the irregular component in percentage terms by dividing it by the trend estimate and multiplying it by 100, i.e.  $(SA - T)/T * 100$ . This measure takes into account the growth in population, and changes in employment and unemployment over the nineteen years' span of data being considered here. Graphs 3 and 4 show the irregular component using this method for persons employed and unemployed, respectively.

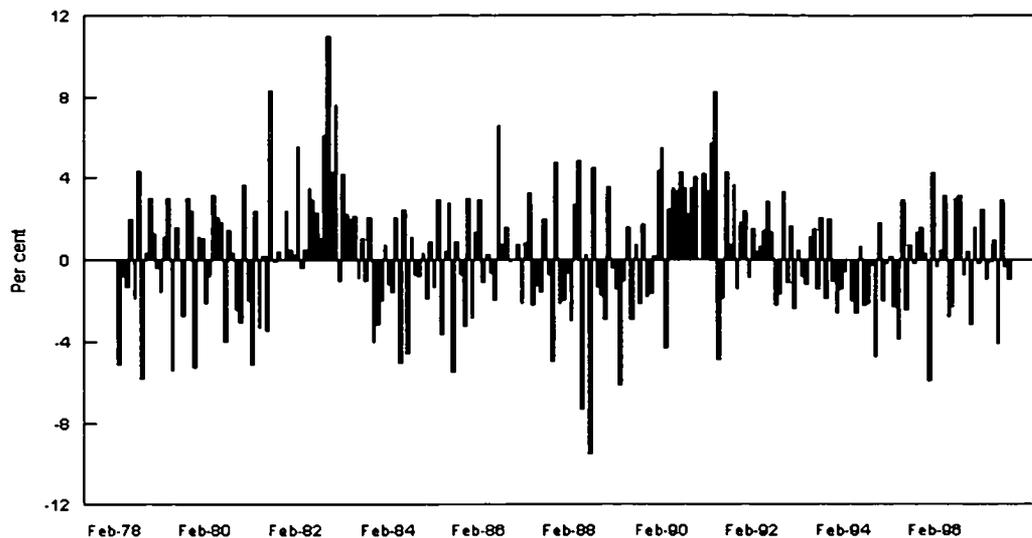

## The seasonally adjusted estimates have not become more volatile than in the past

These more precise measures of volatility show that the seasonally adjusted series is not now appreciably more volatile than in recent years. Graphs 3 and 4 show that marked volatility has occurred from time to

GRAPH 1  
EMPLOYED PERSONS, AUSTRALIA  
SEASONALLY ADJUSTED MONTHLY PERCENTAGE MOVEMENTS

**GRAPH 2  
UNEMPLOYED PERSONS, AUSTRALIA  
SEASONALLY ADJUSTED MONTHLY PERCENTAGE MOVEMENTS**

time for both persons employed and unemployed. However, by and large there has been no appreciable increase in the size of the irregular component in either of the two series in recent years. This is consistent with the observations from **Graphs 1 and 2**.

**Differences in the degree of volatility between the calendar months of the year**

The issue of volatility can be further examined by looking at the irregular component for each month of the year to see if some months are more volatile than others. The curves in **Graphs 5 and 6** represent the seasonal component for each month of the year for employed persons and unemployed persons, respectively. The observations for each month are one year apart, e.g. the last three observations on the curve represent the seasonal component for that particular month over the last three years. The vertical lines between the curve and the arrow heads represent the irregular component, and, the higher the degree of volatility, the longer the line. Both graphs have been estimated with data from February 1978 to September 1997.

It can be seen in **Graph 5** that for persons employed, no month is highly volatile. The largest irregular was recorded in July 1991, but apart from that single incident, July is no more volatile than the other months. The large irregular in July 1991 is thought to be the result of changes that were made to the supplementary survey program, which disturbed the seasonal adjustment factors. **Graph 5** also shows that May and June are relatively non-volatile, with most of their seasonal and irregular components being quite close to the seasonal factor paths. Overall, none of the individual months shows a systematic increase in volatility in recent years.

With regard to persons unemployed, **Graph 6** shows that although April has recorded the two largest irregulars in the series, February appears to be the most volatile. January, May, and August are relatively

non-volatile. As with the series for persons employed, none of the individual months showed a systematic increase in volatility in recent years.

**More formal statistical tests on volatility**

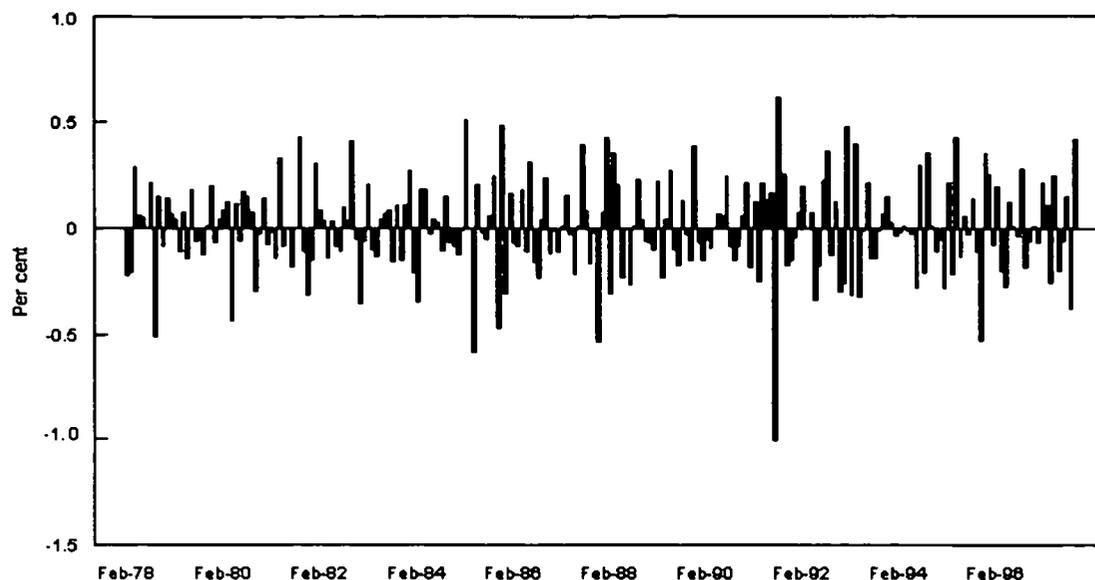

More formal statistical tests on volatility show that the observed values of the irregulars match very well with the statistical distribution that would be expected from a purely random process. Further details can be found in the accompanying technical note.

**The trend estimates**

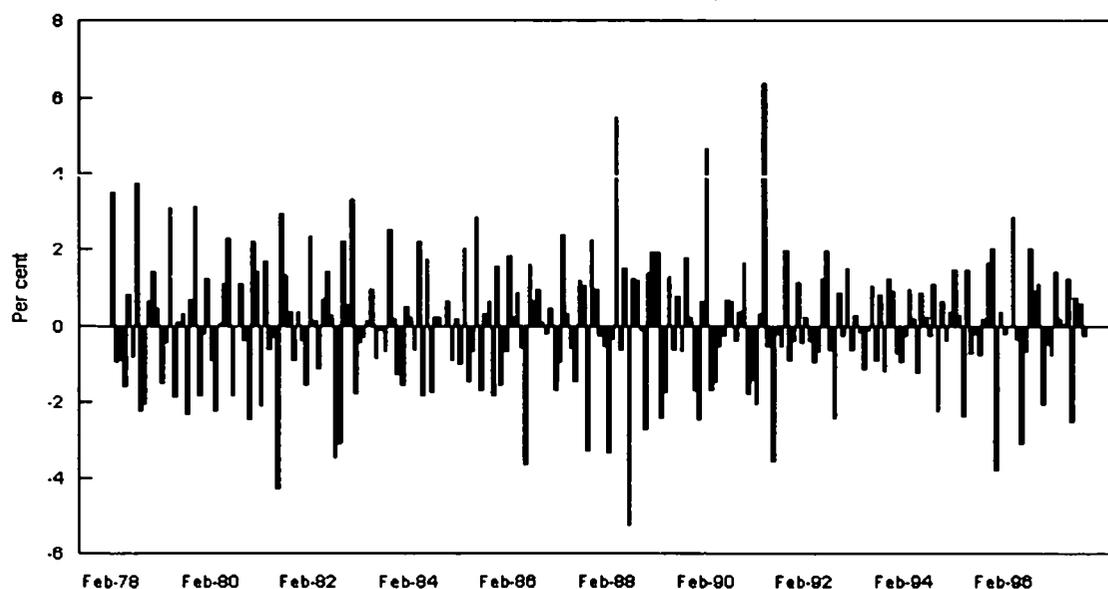

The ABS's trend estimates are obtained by smoothing the seasonally adjusted series using the Henderson moving average method. This filtering process removes the irregular component, and hence provides useful information about the underlying movements in a time series, which can be harder to ascertain from either the original or the seasonally adjusted estimates. In fact, analyses of monthly LFS series indicate that the month to month movement in the seasonally adjusted series is mostly attributed to the irregular component which is not related to the trend. The irregular component accounts for more than half the seasonally adjusted month to month movement with the following frequency:

- Employment —  
5 in 10 monthly movements;
- Unemployment —  
7 in 10 monthly movements;
- Unemployment rate —  
7 in 10 monthly movements; and
- Participation rate —  
9 in 10 monthly movements.

**GRAPH 3  
EMPLOYED PERSONS, AUSTRALIA  
(SEASONALLY ADJUSTED - TREND) / TREND**

**GRAPH 4  
UNEMPLOYED PERSONS, AUSTRALIA  
(SEASONALLY ADJUSTED - TREND) / TREND**

### Conclusions

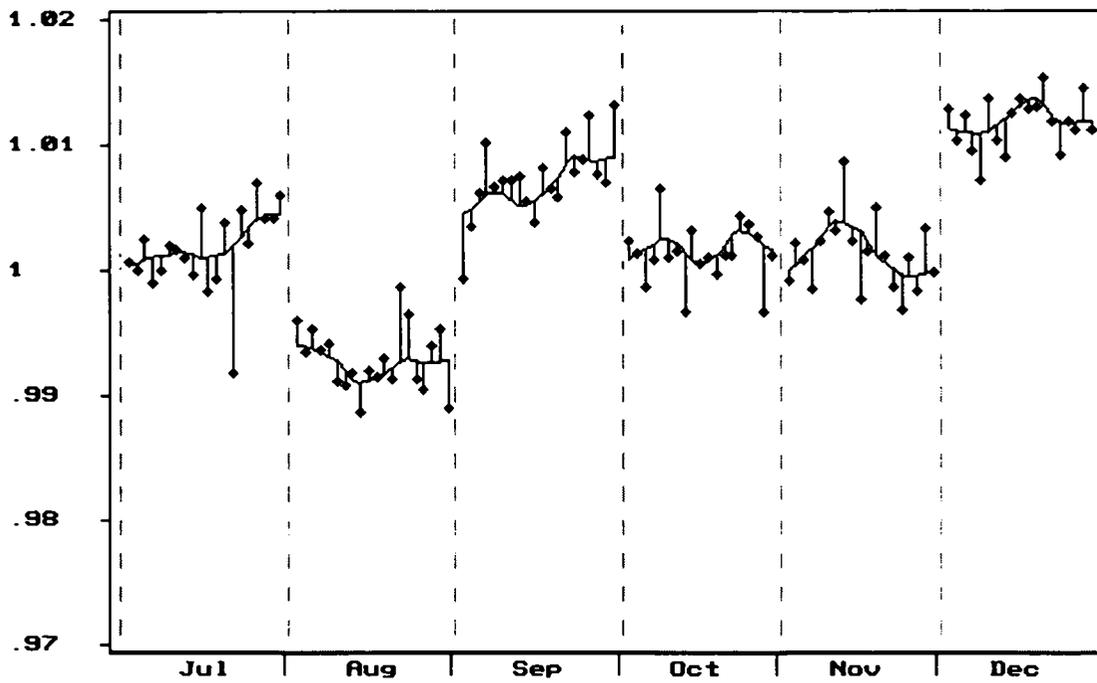

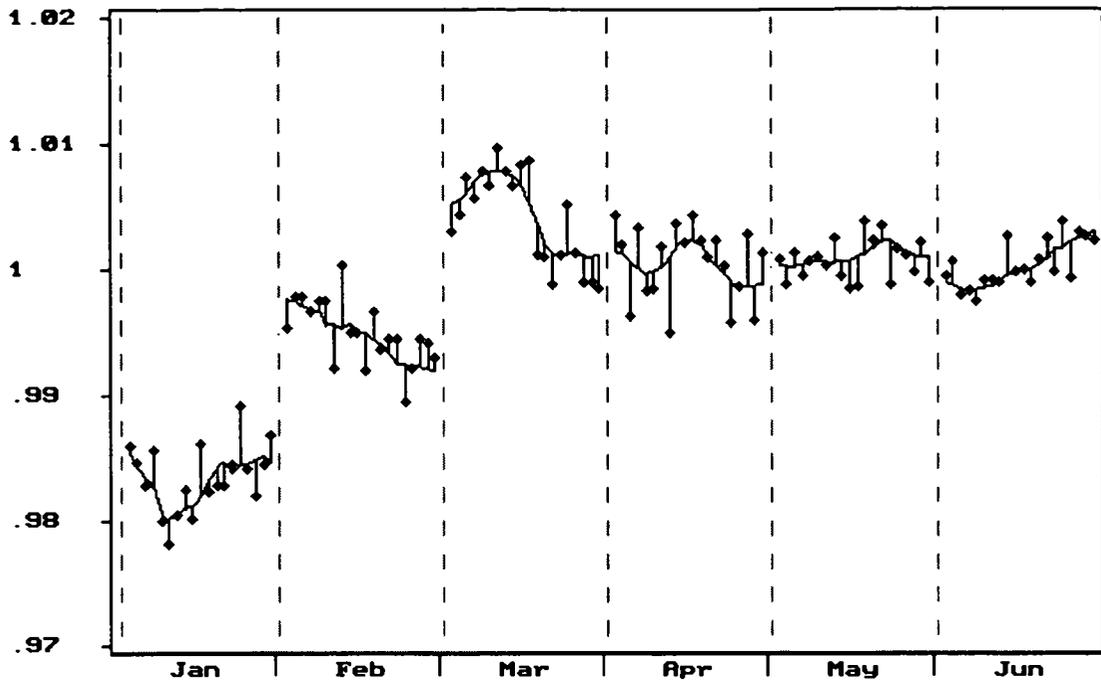

Analyses of monthly LFS series indicate that the month to month movement in the seasonally adjusted series is mostly attributed to the irregular component which is not related to the trend. Therefore, more often than not, examining the month to month movements in the seasonally adjusted LFS series is an approximation to examining the volatility attributed to the irregular component in the series. For this reason, the ABS encourages users to place greater

emphasis on the trend estimate when inferences are drawn about the underlying direction or behaviour of particular statistical series.

# Investigations of Volatility in the Labour Force Survey

## (A Technical Note)

Philip Bell

### Introduction

The key ABS Labour Force Survey (LFS) estimates of employed persons and unemployed persons change from month to month in a way that is to some extent unpredictable. This erratic behaviour of a time series is called 'volatility'. The accompanying feature article uses graphical methods to examine the volatility in the LFS. This Technical Note reports further analysis of this volatility, which confirm and extend the results evident in the Feature Article.

As for the feature article, this note looks at the 'irregulars' of the time series, which are treated as measuring the monthly effects of volatility. It also looks at the contribution of sampling error to the volatility. The following questions are addressed:

- Are the irregulars normally distributed, or are they spread out towards the extremes?
- Is there any evidence that the volatility of the series has changed over time?
- Is there a relationship between month to month irregulars?

### Irregulars of a time series

The irregulars are a result of the time series decomposition of the survey estimates into trend, seasonal and irregular components. For presentation here this decomposition will be treated as additive. (The actual decomposition for LFS estimates of employed persons and unemployed persons is done separately for a number of component series, using a multiplicative approach, and then aggregated to the Australia level). The time series decomposition can be written as:

Survey estimate = Trend + Seasonal + Irregular

The seasonally adjusted estimates are simply the survey estimates with the seasonal component removed. Thus the irregular can be calculated from published data by subtracting the trend estimate from the seasonally adjusted estimate.

### Distribution of the irregulars

Graphs 1 and 2 show the number of times that relative irregulars of particular sizes have been observed since February 1978 (the start of the monthly LFS), for employed and unemployed persons respectively. Overlaid on each graph is the expected frequency distribution for a normal distribution of the same standard deviation. The

standard deviations of the relative irregulars are 0.21 percentage points for employed persons and 1.65 percentage points for unemployed persons.

It appears that the observed irregulars are approximately centred at zero, and their variation is similar to the normal distribution. This is confirmed by formal statistical tests. The Kolmogorov D-test did not detect any significant difference from the normal distribution (giving  $p=0.61$  for employed persons and  $p=0.28$  for unemployed persons as probabilities of observing these irregulars if they were from a normal distribution).

Given the irregulars seem to follow a normal distribution, it is not surprising that occasional irregulars appear that are relatively far from zero, even though most of the observed irregulars are small and close to zero. Occasional large values among a majority of small values is typical for data that are normally distributed.

### Magnitude of the irregulars over time

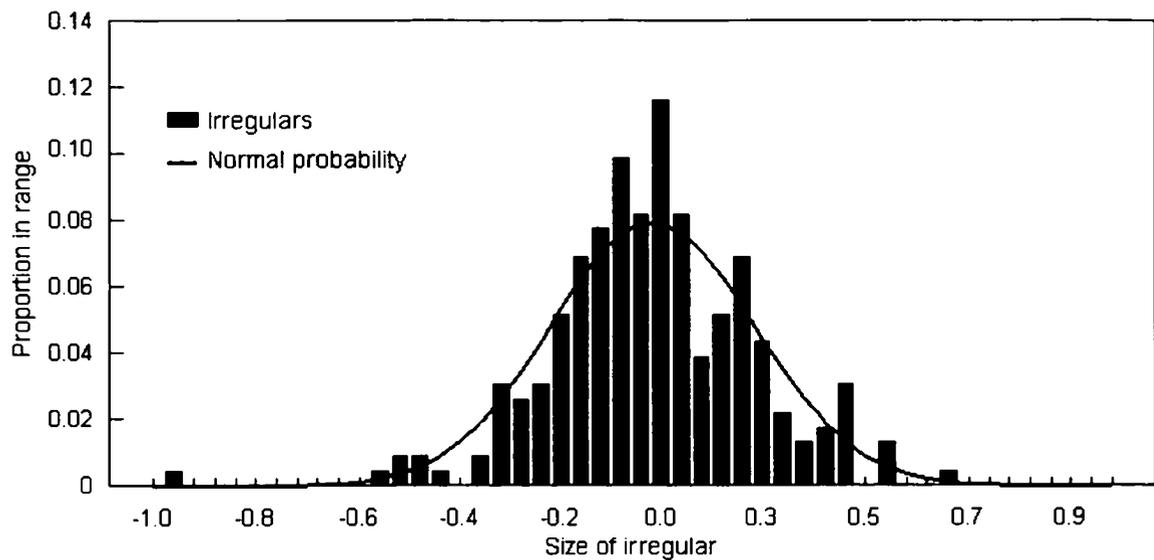

The graphs of irregulars in the feature article (Graphs 3 and 4) show them as being equally scattered above and below zero. This is inevitable, as over time they must average out to zero. It is of interest to consider the magnitude of the irregulars, and to ask: ignoring whether they are positive or negative, have the standardised irregulars become bigger or smaller over time?

Graphs 3 and 4 show the absolute values of the relative irregulars i.e. they show the magnitude of the irregulars, relative to the estimate, without regard to sign. The horizontal line on each graph shows the average magnitude of the relative irregulars over the whole span of data. For employed persons, the average size of the relative irregulars has been about 0.16%, looked at over the whole period of the survey. For unemployed persons, the average size of the relative irregulars has been about 1.25%.

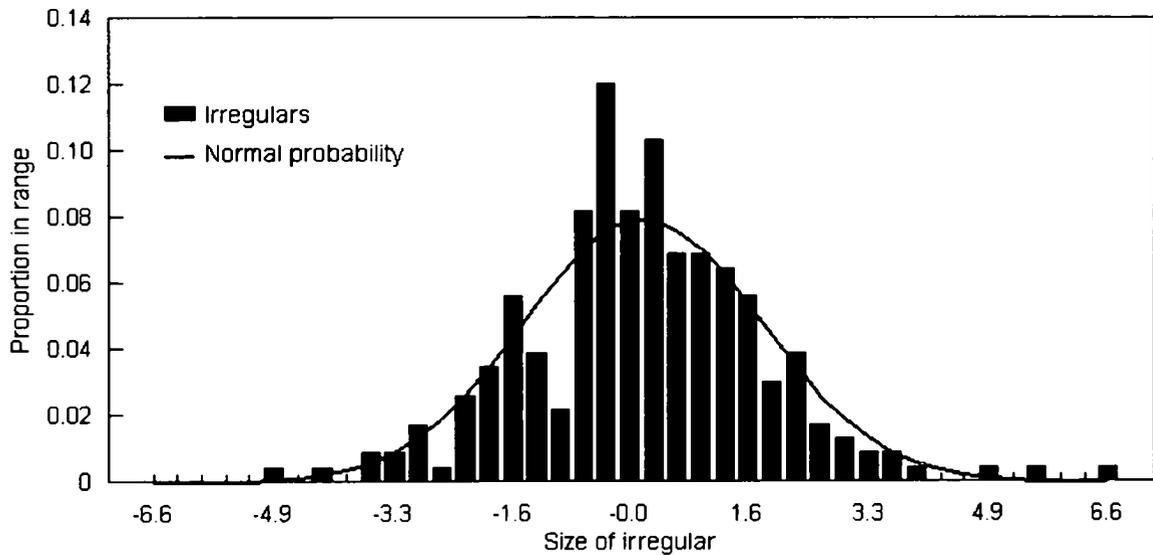

These graphs support the view that there has been no observable deterioration in the stability of the LFS estimates over time. If there had been, there would be a clear pattern of values below the average early in the life of the survey, and above the average in more recent times. This does not occur, for either employed or unemployed persons.

Another feature is drawn out by this presentation. Throughout each series there have been 'quiet' episodes, lasting for periods of around six to nine months, where the volatility of the survey has been below the average, followed by slightly shorter

**GRAPH 1  
EMPLOYED PERSONS, AUSTRALIA  
DISTRIBUTION OF RELATIVE IRREGULARS**

**GRAPH 2  
UNEMPLOYED PERSONS, AUSTRALIA  
DISTRIBUTION OF RELATIVE IRREGULARS**

'noisier' periods, where the volatility has been above the average.

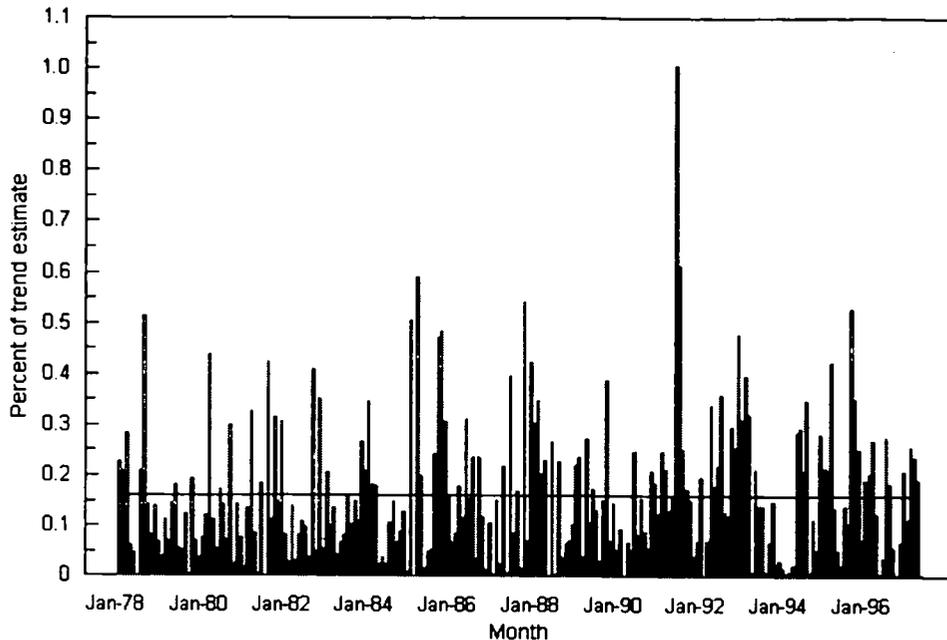

This effect may contribute to occasional concerns in the public arena that LFS estimates are becoming more volatile. This may be the appearance in the short term, when a period of relative stability has been followed by a more volatile period. In the longer term, however, both the employed persons and unemployed persons series have shown no overall increase in volatility.

**Sampling error**

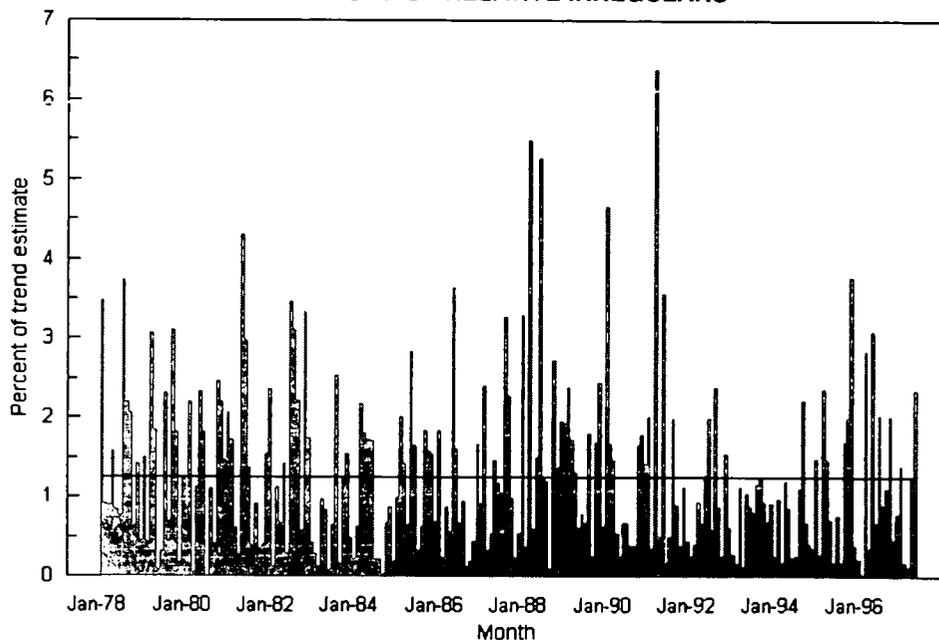

A major contributor to the volatility of the survey estimates is the sampling error. Sampling error is an unavoidable part of any survey, arising because only a portion of the population is surveyed in any month. Assuming negligible survey bias, the effect of sampling error on survey estimates can be written as

$$\text{Survey estimate} = \text{True population value} + \text{Sampling error}$$

**GRAPH 3  
EMPLOYED PERSONS, AUSTRALIA  
MAGNITUDE OF RELATIVE IRREGULARS**

**GRAPH 4  
UNEMPLOYED PERSONS, AUSTRALIA  
MAGNITUDE OF RELATIVE IRREGULARS**

The sampling error on estimates will be approximately normal for theoretical reasons, so it is not surprising that the irregulars appear normal. For further discussion of sampling errors in the LFS see *Labour Force, Australia* (6203.0).

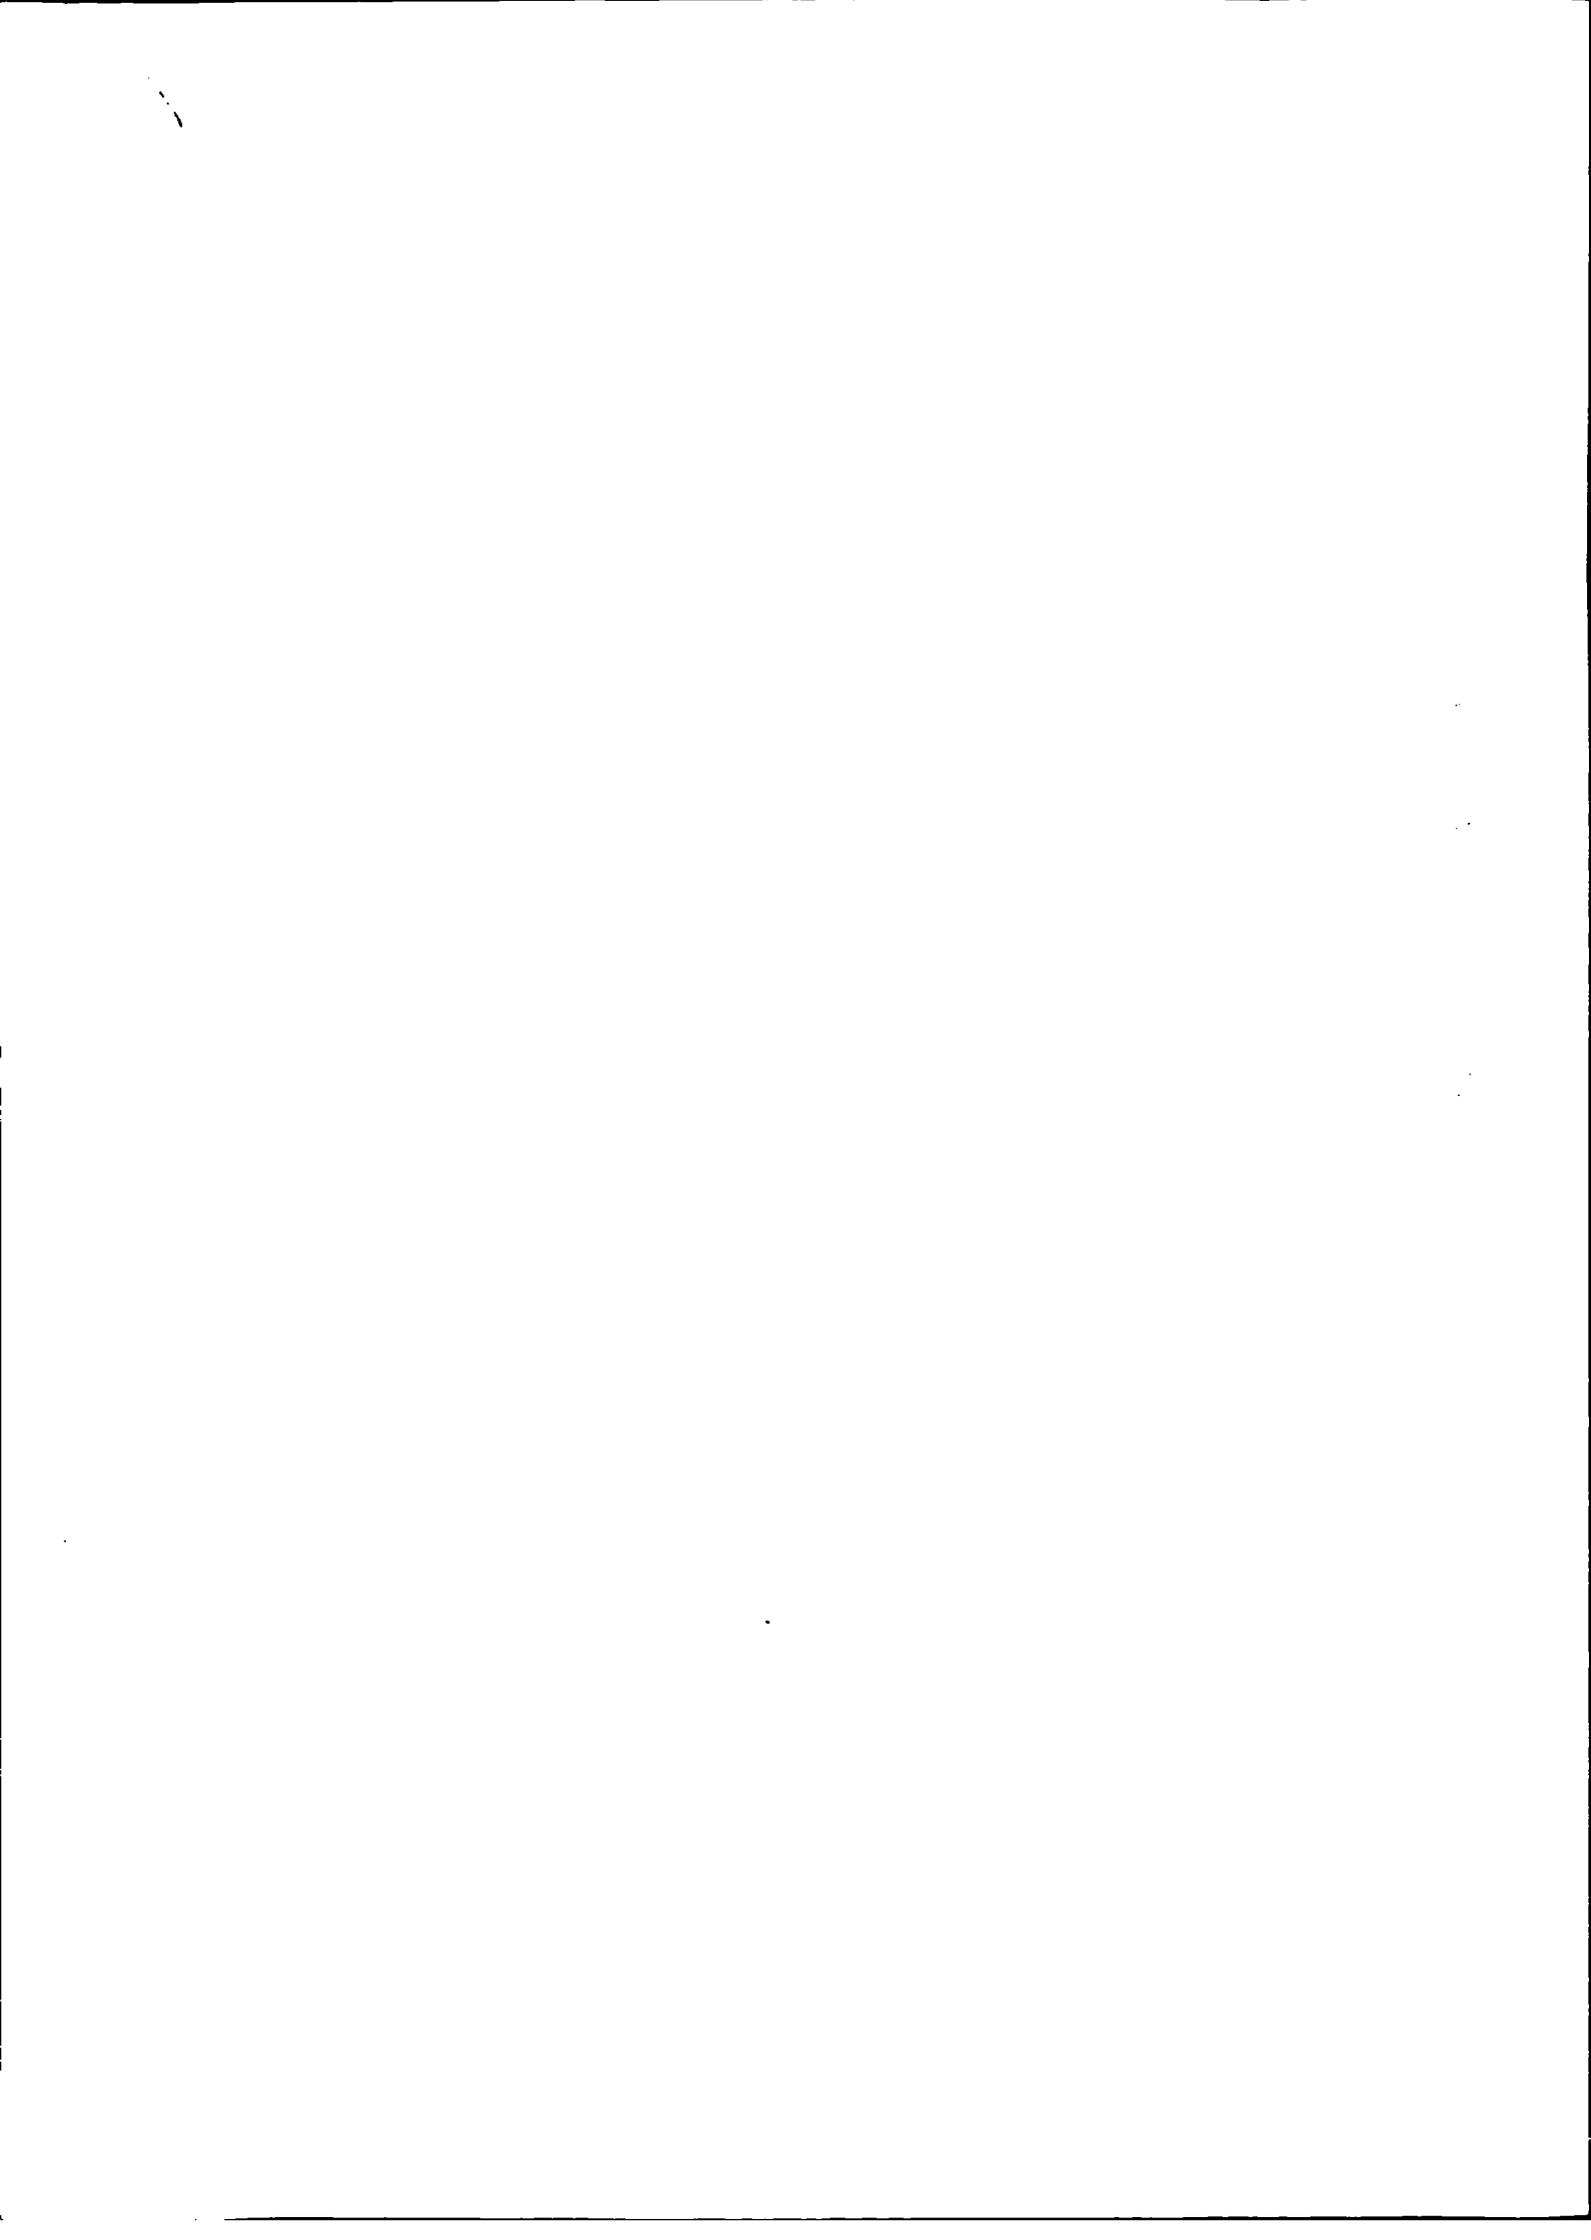

**Conclusions**

The following conclusions can be drawn about the volatility of the Labour Force estimates of employed persons and unemployed persons. First, the irregulars are approximately normal in distribution. Second, the magnitude of the irregulars is not

increasing appreciably over time. Third, there is a tendency for the irregulars to show periods of low volatility separated by shorter periods of higher volatility.

# Composite Leading Indicator

## September quarter 1997

### Most Recent Movement

In the September quarter 1997, the experimental Composite Leading Indicator (CLI) rose 0.03%, following rises of 0.17% and 0.13% in the March quarter and June quarter 1997 respectively. Of the eight components used in its compilation, four made positive contributions, three made negative contributions and one component made no contribution in the September quarter 1997. The largest positive contribution continued to come from the All Industrials index component, while the largest negative contribution came from the trade factor.

The reference series for the CLI is the business cycle of Australia which is defined here as the deviation of the trend in constant price Gross Domestic Product (GDP(A)) from its historical long-term trend. **Graph 1** shows the constant price GDP(A) and the CLI expressed as deviations from their historical long-term trends (the deviation measure is outlined in **Endnote 1**). **Graph 2** shows the trend constant price GDP(A) compared with its historical long-term trend.

As shown in **Graph 1**, the last peak in the reference series was in the March quarter 1996. This peak was largely attributable to the effects of a good farm season in 1995–96, and was not predicted by the CLI (see Feature Article — Impact of the 1995–96 Farm Season on Australian Production, *Australian Economic Indicators*, (1350.0), January 1997). A review of the performance of

the CLI and its components was published in the July 1997 *Australian Economic Indicators*.

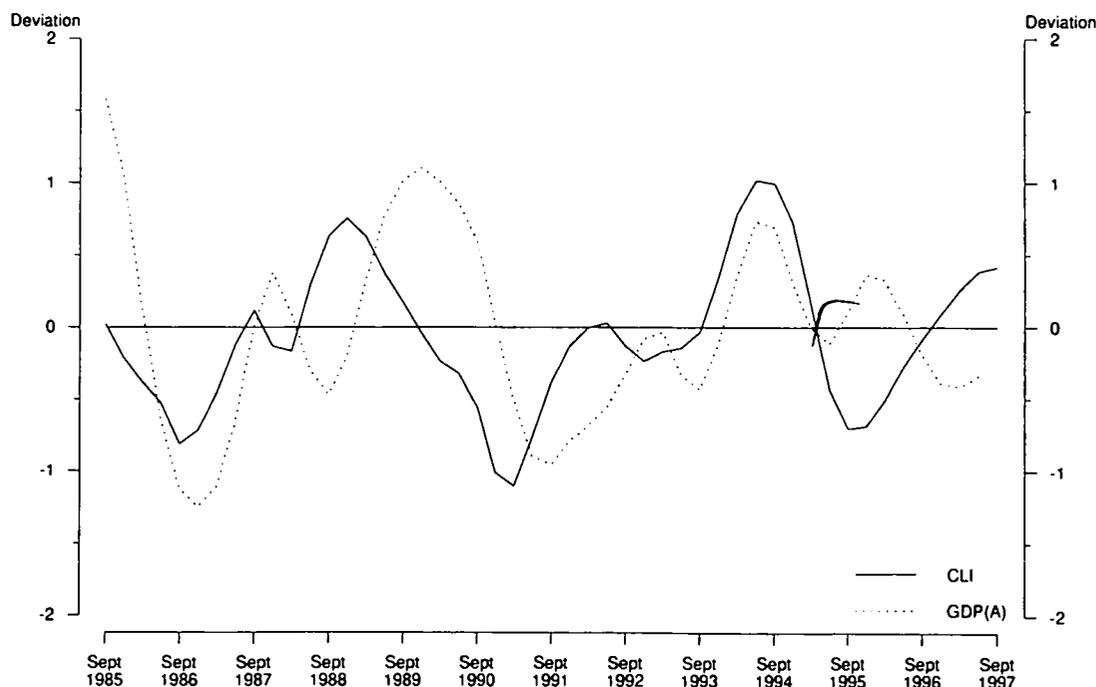

Since the March quarter 1996 the growth rate in trend GDP(A) has been below the growth rate of the historical long-term trend, reflecting a contraction in the business cycle. However, in the June quarter 1997 trend GDP(A) had a slightly higher growth rate than the historical long-term trend of GDP(A). If this is sustained for a number of quarters then an expansionary phase of the business cycle will have commenced.

### Methodology and Interpretation

The CLI has been developed to supplement, rather than to compete with existing forms of economic analysis and forecasting. It is still considered to be experimental and will continue to be published each quarter in *Australian Economic Indicators* (i.e. in the March, June, September and December issues).

The CLI summarises the business cycles present in a selection of economic indicators, which had typically shown turning points ahead of the business cycle in GDP(A) from the early 1970s to the early 1990s. Because the evolution of each expansion and contraction in activity presents a unique combination of features, none of the individual component indicators has had an unvarying or perfectly stable leading relationship with GDP(A).

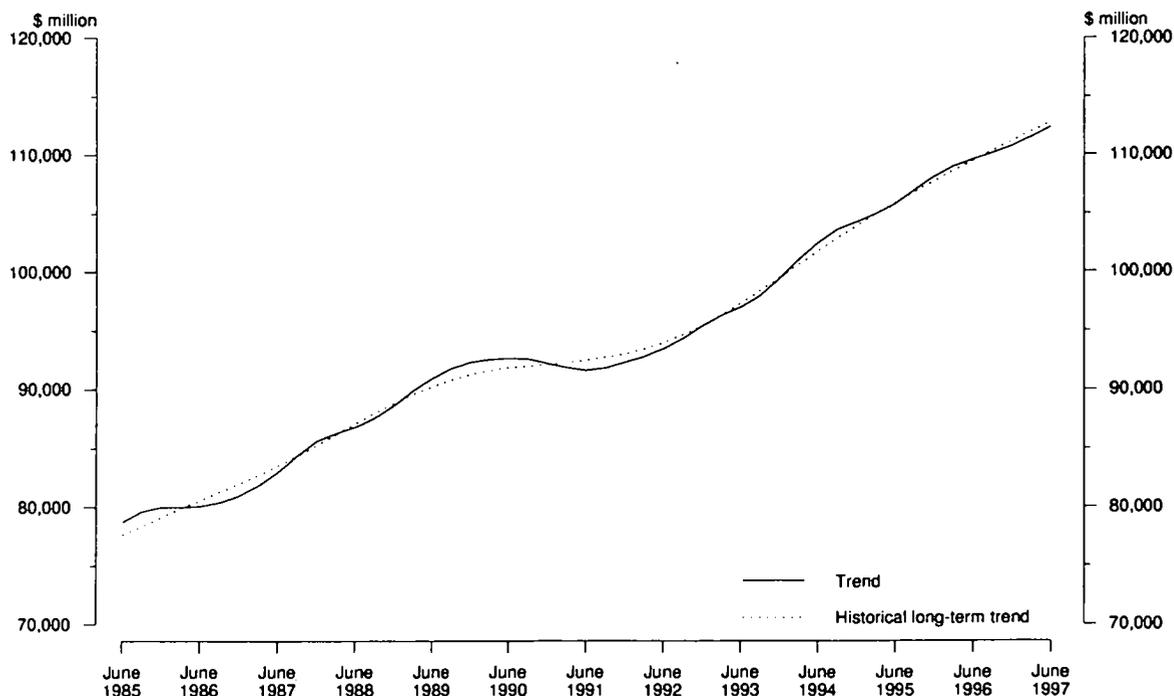

GRAPH 1  
COMPOSITE LEADING INDICATOR (CLI) AND GDP(A)  
DEVIATION FROM HISTORICAL LONG-TERM TREND

Note: In the June quarter 1997, the quarterly long-term trend growth rate of GDP(A) is 0.68% and the trend growth rate is 0.76%.

Table 1 CLI and GDP(A) at average 1989-90 prices — growth rates						
	Jun 1996	Sep 1996	Dec 1996	Mar 1997	Jun 1997	Sep 1997
CLI	-0.27	-0.08	0.09	0.26	0.39	0.42
Change from previous quarter		0.19	0.17	0.17	0.13	0.03
GDP(A) \$m Trend	109,581	110,118	110,732	111,516	112,359	na

GDP(A) \$m Long-term trend	109,487	110,336	111,165	111,980	112,736	na
Percentage change from previous quarter		0.78	0.75	0.73	0.68	na
GDP(A) Deviation from long-term trend	0.09	-0.20	-0.39	-0.41	-0.33	na
Change from previous quarter		-0.28	-0.19	-0.02	0.08	na

GRAPH 2  
GDP(A) AT AVERAGE 1989-90 PRICES

Note: In the June quarter 1997, the quarterly long-term trend growth rate of GDP(A) is 0.68% and the trend growth rate is 0.76%.

If the lead behaviour continues, the CLI would assist in the early detection of turning points in the business cycle in GDP(A). Note that the CLI can merely provide early signals of turning points in the business cycle. It does not predict the level of GDP(A), nor signal recessions or recoveries.

The lead time of the CLI with respect to the reference cycle varies considerably. Past performance of the CLI indicates that it led turning points in the GDP(A) growth cycle by around two quarters on average.

### Non-Farm GDP(A)

A deficiency of the CLI noted in the recent review (see Feature Article — Review of the Experimental Composite Leading Indicator, *Australian Economic Indicators*, (1350.0), July 1997) is its failure to include a series providing a good leading indicator of the farm cycle. Graph 3 provides the non-farm GDP(A) deviation from historical long-term trend, to assist separate assessment of farm and non-farm effects.

GRAPH 3

## Analysis of Component Indicators: Deviation from historical long-term trend

In the September quarter 1997, four of the eight component indicators made positive contributions to the quarterly change in the CLI, three components made negative contributions and one component made no contribution (expressed as deviation from the historical long-term trend, see Table 2). **Graphs 4 to 11** show each component's trend and historical long-term trend.

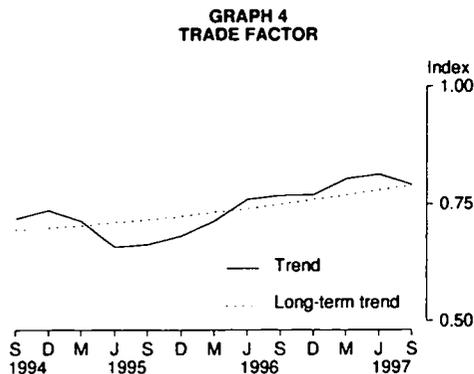

**Positive contributions.** The components making positive contributions to the quarterly change in the September quarter 1997 CLI were the All Industrials index (0.10 points, **Graph 8**), production expectations (0.07 points, **Graph 10**), business expectations (0.02 points, **Graph 11**) and secured housing finance commitments (0.02 points, **Graph 6**).

**Negative contributions.** The components making negative contributions to the quarterly change in the September quarter 1997 CLI were the trade factor (-0.12 points, **Graph 4**), United States GDP (-0.04 points, **Graph 5**) and job vacancies (-0.01 points, **Graph 7**).

**No Contribution.** The inverted, lagged real interest rate component made no contribution, either positive or negative, in the September quarter 1997.

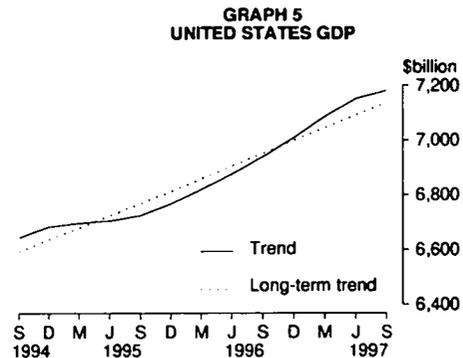

### Trade Factor

The trade factor is defined as the ratio between commodity prices (in terms of Special Drawing Rights), and the price index for imported materials used by Australian producers. This ratio gives an early estimation of the terms of trade. The trend of the trade factor has been above its historical long-term trend since the March quarter 1996. The deviation fell quite sharply in the September quarter 1997 reflecting a fall in the trend and a continued gradual rise in the historical long-term trend. This is the first fall in the trend of this series since the June quarter 1995.

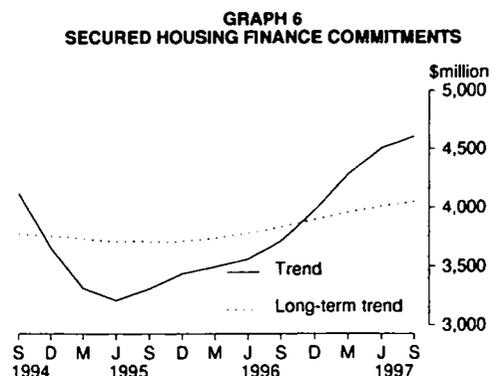

### United States GDP

The historical long-term trend of United States GDP continued to rise in the September quarter 1997. The series has been rising at a fairly constant rate since the December quarter 1992. The trend of United States GDP has been above its historical long-term trend since the September quarter 1996, however this deviation fell in the September quarter 1997 largely as a result of a decelerating rate of rise in the trend.

### Secured Housing Finance Commitments

The historical long-term trend of secured housing finance commitments has been rising gradually since the September quarter 1995, although it has shown signs of a slowing rate of rise in recent quarters. In the December quarter 1996 the trend of secured housing finance commitments moved sharply above its historical long-term trend. However, the rate of rise of the trend series has decelerated in the last two quarters. Despite this slowdown the deviation has continued to grow because growth in the historical long-term trend has been rising even more slowly than the trend in the September quarter 1997.

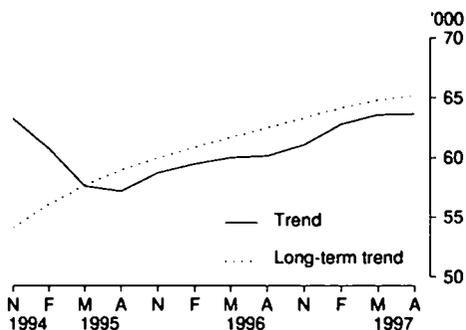

## Job Vacancies

Note that the job vacancies series are referenced to the middle month of a quarter.

The historical long-term trend of the number of job vacancies, although rising continuously since mid-1992, has decelerated since the quarter ended August 1993. The trend of the number of job vacancies has been below its historical long-term trend since the quarter ended May 1995. In the quarter ended August 1997 the negative deviation increased as a result of the smaller rate of rise for the trend compared to the historical long-term trend. This is the first time that the trend has risen more slowly than the historical long-term trend since the quarter ended August 1996.

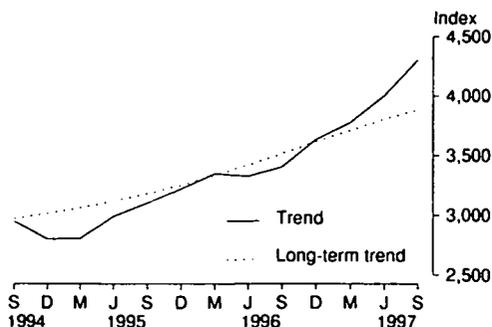

GRAPH 7  
JOB VACANCIES

## All Industrials Index

The trend series of the All Industrials index had been generally below its historical long-term since the June quarter 1994. In the December quarter 1996 the trend series moved sharply above its historical long-term trend. In the last two quarters the trend has been rising at an accelerating rate, while the historical long-term trend has been rising at a fairly constant rate since the June quarter 1995. As a consequence, the deviation between the two series continued to rise in the September quarter 1997. Recent volatility in equity markets around the world has affected the Australian market and may begin to influence this series in the December quarter 1997.

GRAPH 8  
ALL INDUSTRIALS INDEX

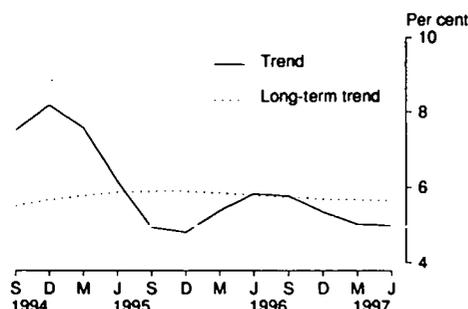

## Real Interest Rate

The historical long-term trend of the real interest rate has been falling very gradually since the September quarter 1995. The rate of growth of the trend has been quite variable over this period, falling sharply in the December quarter 1996 and the March quarter 1997, resulting in a negative deviation. However, the trend fell only slightly in the June quarter 1997, increasing the negative deviation only slightly in this quarter. (Note that it is the inverse of this deviation that is used in the CLI.)

This component is lagged four quarters in the compilation of the CLI. The zero contribution from this component towards the change in the September quarter 1997 CLI, reflects the fact that there was no deviation in the June and September quarter 1996, as shown in Graph 9. It should be noted that for at least the next three quarters this component is expected to make positive contributions to the CLI's movements.

GRAPH 9  
REAL INTEREST RATE

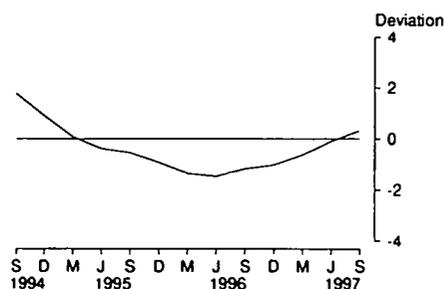

## Production and Business Expectations

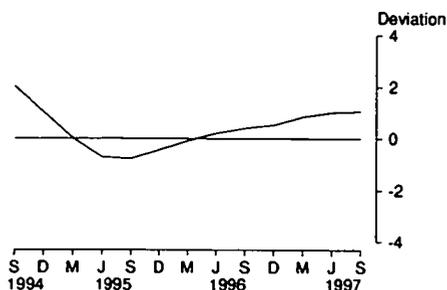

In the September quarter 1997, trend production expectations rose for the fifth consecutive quarter, while trend business expectations have been rising consistently since the September quarter 1995.

Like other CLI components, the production expectations and business expectations series have been smoothed and standardised to display cyclical behaviour. However, these series are not thought to exhibit

GRAPH 10  
PRODUCTION EXPECTATIONS  
TREND

**GRAPH 11  
BUSINESS EXPECTATIONS  
TREND**

long-term trend growth. The source of these expectations series is the Australian Chamber of Commerce and Industry, and Westpac Banking Corporation, *Survey of Industrial Trends*. The ABS also compiles business expectations data. However, these cannot yet be included as a component of the CLI due to the insufficient length of the time series.

#### Longer time series and further details

Details of the compilation of the CLI index can be found in *An Experimental Composite Leading Indicator of Australian Economic Activity*, (1347.0), June 1993, and in the feature articles published in *Austra-*

*lian Economic Indicators* in August and October 1992 and May 1993.

Longer time series of the data presented in this CLI note are now available on PC Ausstats. For further information about these statistics, contact Craig Stevens (02) 6252 5795.

#### Endnotes

1. The unit of measurement varies between CLI components. For example, the real interest rate is measured as a per cent, job vacancies as a number, United States GDP in dollar terms and the trade factor is measured in index number form. The CLI components are therefore standardised to make them comparable.

For each CLI component, the standardisation procedure results in the amplitude having an average of one and a deviation from average of one. The reference series (constant price GDP(A)) is similarly standardised.

The CLI and GDP(A) series shown in **Graph 1**, and the CLI and Non-farm GDP(A) series shown in **Graph 3**, are expressed in terms of their deviation from their historical long-term trend with a standardised amplitude. This measure of deviation has no unit and the deviation scale in **Graphs 1** and **3** (which ranges from -2 to 2) is 'statistically dimensionless'.

(a) : National disposable income is equal to wages, salaries and supplements plus net operating surplus plus indirect taxes less subsidies less net income paid to overseas less unrequited transfers to overseas. It is equal to total outlays which comprises final consumption expenditure plus saving. (a) : Trend data used instead of seasonally adjusted. (b) : Sales is defined as gross non-farm product plus imports of goods and services less changes in private non-farm stocks. (c) : Corporate gross operating surplus includes private corporate trading enterprises plus financial enterprises less imputed bank service charge. GNFPC = Gross non-farm product at factor cost. (d) : Interest paid component contains original data. (e) : By convention, zero productivity growth is assumed for industries in the non-market sector (mainly government and some service industries). Therefore, a better indicator of productivity change is provided by the series showing market sector constant price gross product per hour worked. ## 2 INTERNATIONAL ACCOUNTS

---

### TABLES

2.1	Balance of payments, current account . . . . .	12
2.2	International trade in goods and services at average 1989–90 prices . . . . .	13
2.3	International trade in goods and services . . . . .	14
2.4	Exports of goods by commodity group . . . . .	15
2.5	Imports of goods by commodity group . . . . .	16
2.6	Services . . . . .	17
2.7	Capital account and balancing item . . . . .	18
2.8	International investment position at end of period . . . . .	19
2.9	Levels of foreign debt at end of period . . . . .	19
2.10	Investment income . . . . .	20
2.11	Balance of payments ratios . . . . .	21
2.12	Foreign investment ratios . . . . .	22
2.13	Merchandise trade by country . . . . .	23
2.14	Merchandise trade shares by country . . . . .	24

### CHANGE IN FUTURE ISSUES

The content and presentation of the International Accounts chapter will change from the next issue of *Australian Economic Indicators* (January 1998). Commencing with data for the September quarter 1997, Australia's balance of payments (BOP) and international investment position (IIP) statistics will be compiled and presented on a new basis consistent with the most recent international standards for these statistics.

(a) : Quarterly seasonally adjusted estimates are from *Balance of Payments, Australia* (5302.0) — issued quarterly. The quarterly estimates for goods and services are not necessarily consistent with the corresponding monthly seasonally adjusted estimates, obtained from *International Trade in Goods and Services, Australia* (5368.0) — issued monthly. The differences are to (1) data revisions to the original monthly data not feeding into the quarterly original series, and hence the quarterly seasonally adjusted series, until the next quarterly release of *Balance of Payments, Australia* (5302.0); and (2) differences arising from the seasonal adjustment process, which are explained in *Seasonal Adjustment of Australia's Monthly Balance of Payments Statistics* (5359.0). Source: *Balance of Payments, Australia* (5302.0).

(a) : Equals income payable on foreign investment in Australia less income receivable on Australian investment abroad. (b) : From September 1996, interest payable and receivable is not comparable with prior periods. (c) : Includes dividends, remitted profits of branches and reinvested earnings of direct investment enterprises attributable to their direct investors. (a) : There is a series break between 1985-86 and 1986-87, resulting from a change in survey methodology for engineering construction, introduced from the September quarter 1986. The most significant was the introduction of public sector units into the survey. Source: Manufacturing and Construction Section, ABS.

(a) : Original data provided. (b) : The weights used are based on the average share of Australia's imports from the US, Japan, UK and West Germany from 1984-85 to 1987-88. The four countries are the source for about 60 per cent of Australia's imports. Observations are quarterly averages. A rise (fall) implies a deterioration (improvement) in Australian costs and prices relative to our four major trading partners after adjusting for exchange rate changes. (c) : The relative domestic price of non-traded goods compared with imported goods. The relative domestic price index can be used to indicate possible resource flows between the domestic traded and non-traded goods sectors in a small economy that engages in international trade. A decrease in the price of non-traded goods relative to imported goods in the domestic economy — that is, a fall in the relative domestic price — encourages a flow of resources into the traded goods sector, thereby encouraging additional exports and import replacement. (d) : The adjusted CPI index is the ratio of the Australian consumer price index to the weighted geometric average of the exchange rate adjusted consumer price indexes of Australia's four major trading partners. (e) : The adjusted GDP deflator index is the ratio of the GDP deflator for Australia to the weighted geometric average of the exchange rate adjusted GDP deflators of Australia's four major trading partners. (f) : The adjusted unit labour cost index is the ratio of unit labour costs in the non-farm sector of the Australian economy to the weighted geometric average of the exchange rate adjusted unit labour cost indexes estimated for the business sectors of Australia's four major trading partners. Source: Australian National Accounts: National Income, Expenditure and Product (5206.0), Australian Bureau of Agricultural and Resource Economics (ABARE) and Department of Treasury.

(a) : See Appendixes A and B, *Consumer Price Index* (6401.0), September Quarter 1994. (b) : This series covers approximately 84 per cent of the total CPI basket. (c) : Comprises the All Groups CPI excluding: Fresh fruit and vegetables, Mortgage interest charges, Automotive fuel and Consumer credit charges. The resulting series covers approximately 85 per cent of the total CPI basket. (d) : Comprises the All Groups CPI excluding: items in (c), Government-owned dwelling rents, Fuel and light, Local Government rates and charges, Postal and telephone services, Motoring charges, Urban transport fares, Health services, Pharmaceuticals and Education and child care. The resulting series covers approximately 69 per cent of the total CPI basket. (e) : Comprises the All Groups CPI excluding: items in (c) and (d) (except Motoring charges), Meat and seafoods, Clothing, Tobacco and alcohol and Holiday travel and accommodation. The resulting series covers approximately 51 per cent of the total CPI basket. Source: *Consumer Price Index* (6401.0).

March			0.18	0.17	0.4				

(a) : Total population increase is equal to the change in population. Prior to 1992 this is not equal to natural increase (live births less deaths) plus net immigration because of the distribution of the intercensal discrepancy. There is now an intercensal discrepancy for 1986-91. (b) : Includes Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory from September quarter 1993. Source: Australian Demographic Statistics (3101.0).

(a) : Excludes Commonwealth and State Government and interbank deposits but includes deposits of the private non-bank sector with the Reserve Bank. (b) : Currency plus bank deposits (including certificates of deposit with trading banks) of the private non-bank sector. (c) : Borrowings (other than from banks and related corporations) by permanent building societies, credit co-operatives, finance companies, authorised money market dealers, pastoral finance companies, money market corporations, general financiers and cash management trusts; less borrowings by authorised money market dealers from those non-bank intermediaries. Breaks occur from time to time due to changes in the number of reporting corporations. (d) : M3 plus borrowings from private sector by non-bank financial intermediaries less the latter's holdings of currency and bank deposits. (e) : Holdings of notes and coin by the private sector, plus deposits of banks with the Reserve Bank and Reserve Bank liabilities to the private non-bank sector. (f) : Loans and advances of those financial intermediaries whose deposit liabilities are included in broad money. (g) : Bills outstanding under acceptance and endorsement commitments by banks. (h) : Credit is equal to bank bills outstanding plus loans and advances by financial intermediaries whose liabilities are included in broad money. Source: Reserve Bank of Australia Bulletin (RBA).

(a) : Extreme care should be exercised in using the trend series for number of building approvals in the Northern Territory and the Australian Capital Territory. The highly erratic nature of these data makes reliable estimation of the trend very difficult. Source: *Building Approvals, Australia* (8731.0).

10.10	Employment index . . . . .	111
10.11	Unemployment rates . . . . .	112
10.12	M1 plus quasi-money index . . . . .	113
10.13	Consumer price index (excluding shelter) . . . . .	114

## NOTES

1. The statistics for Germany in these tables refer to Germany after unification.

2. **Consumer price index.** Due to the many differences in the structure of the housing sector in different countries and in the way that housing is treated in their CPIs, a simple comparison of All items (or headline) CPIs is often inappropriate. To provide a better basis for international comparisons, the Fourteenth International Conference of Labour Statisticians adopted a resolution which called for countries to "provide for dissemination at the international level of an index which excludes shelter, in addition to the all-items index."

Table 10.13 presents indexes for selected countries on a basis consistent with the above resolution and comparable to the Australian series *All groups excluding housing*. The series in this table are presented on a reference base consistent with that used for publication of the Australian CPI (i.e. 1989-90 = 100.0) and as such are not directly comparable with those for All items published in Table 10.7 (presented on a reference base of 1990 = 100.0).

# GENERAL INFORMATION

## Structure of *Australian Economic Indicators* and Cross Referencing

*Australian Economic Indicators* takes a market or activity approach to the presentation of statistics. The relationship between this structure and the four consolidated accounts that comprise the National Accounts is shown in Table A below. Table B following provides a cross-reference guide to industry and sector statistics.

**Table A - Cross Reference to National Accounts Aggregates**

<i>I DOMESTIC PRODUCTION ACCOUNT</i>			
	<i>Chapter</i>		<i>Chapter</i>
Wages, Salaries and Supplements	1,7	Consumption	1,3
Gross Operating Surplus	1,7	Investment	1,3
Net Indirect Taxes	1	Increase in Stocks	1,3,4
		Exports less Imports	1,3
<hr/>		<hr/>	
Gross Domestic Product (income based)	1	Gross Domestic Product (expenditure based)	1
<hr/>			
<i>II NATIONAL INCOME AND OUTLAY ACCOUNT</i>			
	<i>Chapter</i>		<i>Chapter</i>
Consumption	1,3	Wages, etc.	1,7
Saving	1,7	Net Operating Surplus	1,7
		Net income/transfers from Overseas	1,2,7
		Net Indirect Taxes	1
<hr/>		<hr/>	
Disposal of Income	1,7	National Disposable Income	1,7
<hr/>			
<i>III NATIONAL CAPITAL ACCOUNT</i>			
	<i>Chapter</i>		<i>Chapter</i>
Investment	1,3	Depreciation	1,7
Increase in Stocks	1,3,4	Saving	1,7
Net Lending to Overseas	2		
<hr/>		<hr/>	
Gross Accumulation	1	Finance of Gross Accumulation	1
<hr/>			

**Table B - Cross Reference to Industry and Sector Statistics**

<i>Chapter</i>	<i>National Accounts</i>	<i>International Accounts</i>	<i>Consumption and Investment</i>	<i>Production</i>	<i>Prices</i>	<i>Labour Force and Demography</i>	<i>Incomes and Labour Costs</i>	<i>Financial Markets</i>
<i>Sector, Industry</i>	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

Electricity, gas and water	3		1	2		6		
Construction	3		5	6-11	7-9	6,8		2,3
Wholesale and retail trade	3		1-4,6	1,2	1,2,6			
Transport and storage	3	3,4	1		1	6,8		
Communication	3		1			6,8		
Finance, property and business services	3		1,5,7			6		
Public administration and defence	3		8,9			6		
Community services	3		8,9			6		
Recreation, personal and other services	3		1,8,9	12	1	6		
Ownership of dwellings	3		1,4		1,2,7			2,3

Note: Chapter 10, International Comparisons is not included in this table as most data in this chapter are at a national level, not sector or industry.  
 (a): In the National Accounts chapter, the trading enterprises sector includes only corporate trading enterprises, and the households sector also includes unincorporated enterprises.

## Explanatory Notes

Explanatory notes in the form found in other ABS publications are not included in *Australian Economic Indicators*. Readers are directed to the explanatory notes contained in related ABS publications.

Other useful sources of detailed information are the 'Concepts, Sources and Methods' and classification publications. These are released irregularly, each relating to a specific publication, collection or standard classification. Some of the publications most relevant to *Australian Economic Indicators* are:

*Australian and New Zealand Standard Industrial Classification (ANZSIC) (1292.0)*

*Classification Manual for Government Financial Statistics, Australia (5514.0)*

*Australian National Accounts: Concepts, Sources and Methods (5216.0)*

*Balance of Payments, Australia: Concepts, Sources and Methods (5331.0)*

*A Guide to Labour Statistics (6102.0)*

*The Australian Consumer Price Index: Concepts, Sources and Methods (6461.0)*

## Related Publications

A list of related publications is included in each chapter under the table of contents. These include publications which are the source of the data in the tables and other related publications.

## Seasonally Adjusted and Trend Estimates

Series in this publication include original, seasonally adjusted and trend series. Special care should always be taken in interpreting data for the most recent months and quarters. Some of the original and all of the seasonally adjusted and trend series are subject to revision.

It is not uncommon for movements in original time series data and those provided from seasonally adjusted and trend series to differ significantly. Movements in a time series of original data may reflect several factors, including:

- longer-term changes in the item being measured (i.e. trend movements);
- short term irregular changes;
- regular seasonal influences;
- normal 'trading', 'working' or 'pay' day patterns; and
- systematic holiday effects.

Seasonal adjustment and trend estimates help the user to identify the effect of these influences on the time series. Seasonal adjustment removes the effect of the last three listed influences from the data, leaving only the trend and short term irregular movements. Trend estimates are then obtained by removing the effects of the short term irregularities, which in many series can be a major contributor to movements in the original data. By comparing the historical trend series with the seasonally adjusted series, the user can identify the short term irregularities which have influenced the original series.

The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia 1983 (1308.0)*. The method used to estimate trends is described in the Information Paper *A Guide to Smoothing Time Series - Estimates of Trend (1316.0)*.

Trend estimates produced by the ABS are based on Henderson Moving Averages, and are therefore subject to revision especially for the latest few months or quarters.

## Constant Price Estimates

Constant price statistics in this publication, refer to estimates in 1989-90 dollar terms, and measure values expressed at the average prices prevailing that year. Period-to-period movements in constant price estimates provide what are often called 'changes in real terms'.

## Implicit Price Deflators

An implicit price deflator (IPD) is a price index obtained by dividing the current price value of a statistical aggregate by its constant price value and as such has the form of a current weighted price index. The change in the IPD between any two periods represents the effects of actual price changes and the effects of relative changes in the underlying quantity weights, or physical composition of the aggregate from which the deflator is formed.

## Symbols and Other Usages

billion = thousand million

The following *symbols*, where shown in columns of figures or elsewhere in tables, mean:

- na data not available: due to either some series starting later than others, no seasonally adjusted data for some series, or data not published for other reasons. Note that where a time series is not available the symbol na is used followed by empty cells.
- nya data not yet available: used in tables from multiple sources where some series' end-dates are shorter than that of the table itself.
- . . not applicable.
- 0, 0.0 nil or rounded to zero.
- nec not elsewhere classified.
- nes not elsewhere specified

Columns in bold in the tables indicate a total. Columns usually sum from the left, with the total appearing on the right. Some tables include sub-total columns and columns which need to be subtracted to obtain the total. Where this is not clear a footnote explains the relationship between the columns.

Columns in italics indicate that seasonally adjusted or trend estimates are not available for that column, and original data are provided instead.

Yearly periods shown as, e.g. 1988-89, refer to the fiscal year ended 30 June 1989.

Where figures have been rounded, discrepancies may occur between sums of the component items and totals. Percentage changes may not be exactly comparable to tabulated source series due to rounding of the source series, the percentage change series or both.

## Metric Prefixes

- Deca (da) = ten  
Hecto (h) = hundred  
Kilo (k) = thousand  
Mega (M) = million  
Giga (G) = thousand million  
Tera (T) = million million
