JUN QTR 1997 KEY POINTS

TREND ESTIMATES

- GDP(A) increased by 0.8% in the June quarter to a level 2.5% higher than in June quarter 1996.
- All three independent measures increased in the June quarter, with GDP(I) up 0.6%, GDP(E) up 0.7% and GDP(P) up 0.9%.
- Gross farm product increased by 0.7% in the June quarter, while the average measure of gross non-farm product increased by 0.8%.

SEASONALLY ADJUSTED ESTIMATES

- GDP(A) increased by 1.2% in the June quarter to be 3.2% higher than in June quarter 1996.
- All three independent measures recorded similar increases, with GDP(I) and GDP(P) up 1.2% and GDP(E) up 1.3% in the June quarter.
- The implicit price deflator for GDP increased by 0.6% in the June quarter to a level 1.9% higher than in June quarter 1996.
- A number of large transactions took place in the June quarter, and although they had no impact on GDP, they had major impacts on some of its components. Refer to the notes on pages 10 and 11 for details.

NOTES

FORTHCOMING ISSUES	ISSUE	RELEASE DATE
	5206.0 <i>Australian National Accounts: National Income, Expenditure and Product</i> , September quarter 1997	3 December 1997
	5242.0 <i>Australian National Accounts: State Accounts</i> , June quarter 1997	25 September 1997
	(FINAL ISSUE — Some series will continue to be available through a special data service and on PC Ausstats from September quarter 1997. Further information can be obtained from the officers named on the cover of this publication.)	

CHANGES IN THIS ISSUE	<p>An Information Paper <i>Improvements to ABS Economic Statistics, 1997</i> (1357.0) was released on 22 August 1997. It provided details about improvements to the coverage of many ABS economic collections which are used as source data for compiling the national accounts, and also about improvements to the constant price estimation methodology for the finance and insurance industry in the national accounts. Both sets of improvements result in adjustments to national accounting aggregates that significantly improve the consistency and coherence of the estimates in recent years. The impact of the adjustments on the annual estimates of GDP and its components from 1991-92 was provided in Tables 1 to 4 at the back of the Information Paper.</p> <p>The coverage improvements relate to revamped procedures for updating the ABS Business Register and improved methodology for deriving estimates for new businesses not yet included on the ABS Business Register. The improved methods for deriving constant price estimates for the finance and insurance industry affect the statistics for both gross product and associated expenditure statistics. This industry is also now included in the labour productivity statistics for the market and non-farm market sectors. See the Technical Note on page 117 for details of these new constant price estimation methods.</p> <p>Supplementary annual tables have been included to provide annual sector income and outlay accounts and public sector capital accounts (see Tables 71 to 81).</p>	

REVISIONS IN THIS ISSUE	<p>Improved data from various ABS surveys and new methods for constant price estimation of the finance and insurance industry (see discussion above under <i>Changes in this issue</i>) have been used in compiling the national accounts estimates for this publication. This has resulted in revisions over many years. See the note on page 12 for details of seasonal reanalyses which have been undertaken for affected series.</p> <p>In addition, quarterly estimates for some components of GDP(I) and GDP(E) have been revised as a result of incorporating annual benchmark data and more complete survey data. Revisions to the constant price estimates of gross product for the manufacturing industry have also resulted from the introduction of annual benchmarks for 1995-96.</p>	

W. McLennan

JUNE QUARTER

SUMMARY COMMENT

FINAL CONSUMPTION EXPENDITURE

- Private expenditure grew by 0.7% (0.8% seasonally adjusted), with increases in most categories. The major contributors to growth were purchases of motor vehicles and other services. Categories which recorded falls included furniture and floor coverings and net expenditure overseas.

PRIVATE GROSS FIXED CAPITAL EXPENDITURE

- Dwelling construction grew by 3.6% (4.0% seasonally adjusted) in the June quarter. Investment in equipment rose 3.3% (16.6% seasonally adjusted) while non-dwelling construction rose 0.5% (2.1% seasonally adjusted). However, there was a significant purchase of an asset from the public sector in the June quarter — see note on page 10.

INCREASE IN PRIVATE NON-FARM STOCKS

- Private non-farm stocks showed a fall of \$76 million (increase of \$628 million in seasonally adjusted terms) in the June quarter.

EXPORTS OF GOODS AND SERVICES

- Exports of goods and services increased by 1.6% (11.3% seasonally adjusted) in the June quarter, with goods growing 1.7% and services up 1.2%. There were some large irregular exports in the June quarter that are affecting the seasonally adjusted estimates — see note on page 11.

IMPORTS OF GOODS AND SERVICES

- Imports of goods and services increased by 3.2% (6.3% seasonally adjusted) in the June quarter, with goods increasing by 3.5% and services increasing by 2.1%.

JUNE QUARTER

SUMMARY COMMENT

AGRICULTURE, FORESTRY AND FISHING

- Increased by 0.6% in trend terms, but fell by 1.2% in seasonally adjusted terms. The latter was mainly due to strong growth in seed and fodder inputs.

MANUFACTURING

- The trend estimate increased by 0.6% and the seasonally adjusted estimate increased by 2.4%. The growth in seasonally adjusted terms was widespread and largely reflected an increase in sales by manufacturers.

CONSTRUCTION

- The fall of 1.2% in trend terms (2.3% in seasonally adjusted terms) was confined to the private sector. The seasonally adjusted decline in the June quarter was mainly due to a fall in the construction of non-residential buildings.

WHOLESALE AND RETAIL TRADE

- The trend estimates increased by 1.1% and 0.6% respectively. The corresponding seasonally adjusted increases were 0.9% and 0.4%, respectively. Sales of motor vehicles was the major contributor to growth in retail trade.

PROPERTY AND BUSINESS SERVICES

- Was the major contributor to growth, with substantial increases in both in the June quarter (2.5%) and over the year to June (8.5%). Note that hours worked is used to estimate the growth in the constant price gross product of this industry.

Comments are based on trend constant price estimates, unless otherwise stated.

MAIN FEATURES INCOME AT CURRENT PRICES

	TREND.....			SEASONALLY ADJUSTED.....		
	Quarterly % change	Annual % change	% points contribution to growth in GDP(I)	Quarterly % change	Annual % change	% points contribution to growth in GDP(I)

JUNE QUARTER

SUMMARY COMMENT

WAGES, SALARIES AND SUPPLEMENTS

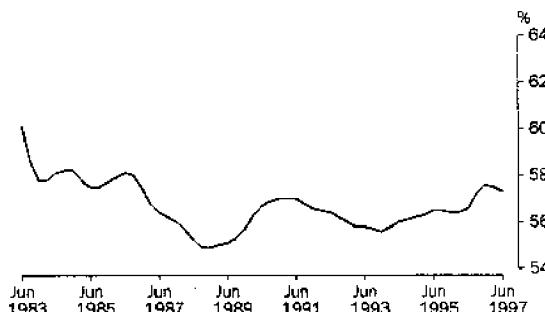

- Rose 0.6% in both trend and seasonally adjusted terms.
- The rise reflects an increase in average earnings of 0.8%, partly offset by a fall in the number of wage and salary earners of 0.2%. In seasonally adjusted terms, average earnings rose 1.1%, while the number of wage and salary earners declined by 0.6%.

GROSS OPERATING SURPLUS

- In the June quarter, the GOS of private corporate trading enterprises increased by 1.6%, following a 0.9% increase in the March quarter. In seasonally adjusted terms, GOS increased 6.5% in the June quarter, after falling by 3.2% in March quarter 1997.

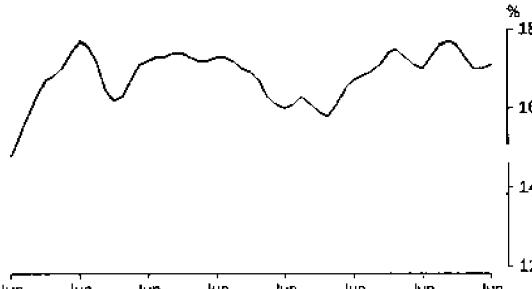

WAGES SHARE OF GDP

(AT FACTOR COST)(a)

PROFIT(b) SHARE OF GDP

(AT FACTOR COST)(a)

(a) GDP at factor cost is equal to the sum of wages, salaries and supplements and gross operating surplus (i.e. it equals GDP(I) less net indirect taxes).

(b) GOS of private corporate trading enterprises.

ANALYSES AND COMMENTS

RELIABILITY OF CONTEMPORARY TREND ESTIMATES

Seasonally adjusted series include both the trend effects and the irregular effects which influence movements in a series. As a result, seasonally adjusted estimates do not necessarily provide a good indication of the underlying behaviour of a series. On the other hand, trend estimates represent the underlying direction of the series, excluding seasonal effects and residual/irregular factors. Trend estimates are calculated by smoothing the seasonally adjusted series using a statistical procedure based on centred Henderson moving averages. The procedure used is designed to minimise distortions in the trend level, turning point shape and timing of turning points.

For the most recent quarters, insufficient data exist to use centred Henderson moving averages to calculate the trend values and so approximations to the Henderson moving averages are used for the latest three quarters. This means that revisions to the trend estimates for the last few quarters are unavoidable, even if none of the original data have been revised. More details about trend estimation are contained in the ABS Information Paper *A Guide to Interpreting Time Series — Monitoring Trends: An Overview* (1348.0) which was released on 19 April 1993.

Potential revisions to trend estimates can be indicated by showing the effects of particular changes in seasonally adjusted estimates that might occur in the next quarter. The table below shows the trend estimates for the last few quarters and the values to which they would be revised if the notional movements in seasonally adjusted GDP(A) actually occurred in September quarter 1997.

Seasonally adjusted growth of 0.5% is required in September quarter 1997 to maintain the trend growth, in September quarter, of 0.8% currently estimated for June quarter 1997.

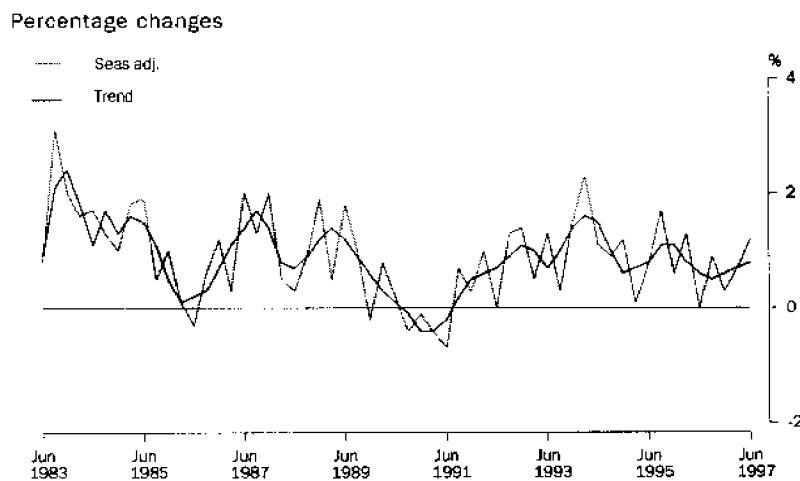

TREND ESTIMATE — PERCENTAGE CHANGE IN GDP(A)

	<i>Seasonally adjusted GDP(A) as published in table 1</i>	<i>Trend GDP(A) as published in table 1</i>	<i>Trend estimate if seasonally adjusted GDP(A) changes by the following amounts in September quarter 1997</i>

ANALYSES AND COMMENTS *continued*

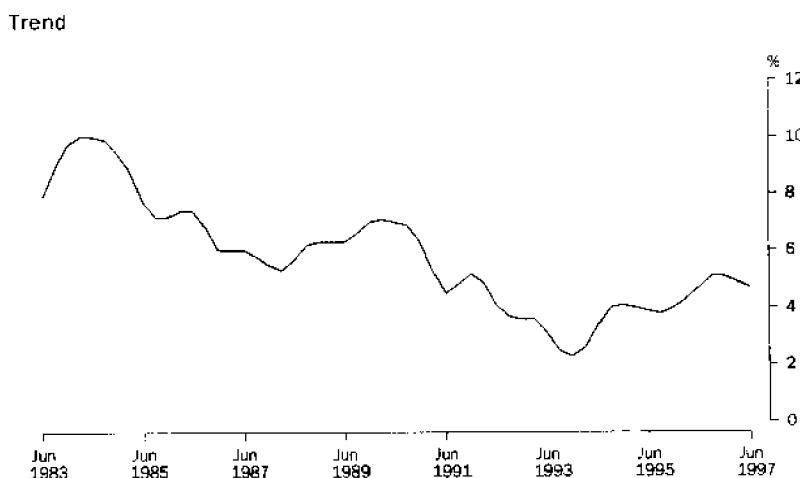

GROWTH RATES IN GDP(A)

The graph below provides a comparison of the quarterly growth rates (percentage changes) in constant price GDP(A) in both seasonally adjusted and trend terms in recent years.

HOUSEHOLD SAVING RATIO

The proportion of household disposable income devoted to consumption in the June quarter was 95.3%, based on trend data. The balance, household saving, was 4.7%. Caution should be exercised in interpreting this ratio in recent years, because major components of household income and expenditure may still be subject to significant revisions. The impact of these revisions on the saving ratio can cause changes in the apparent direction of the trend. The following graph presents the household saving ratio derived from trend data (see Explanatory Notes, paragraph 26).

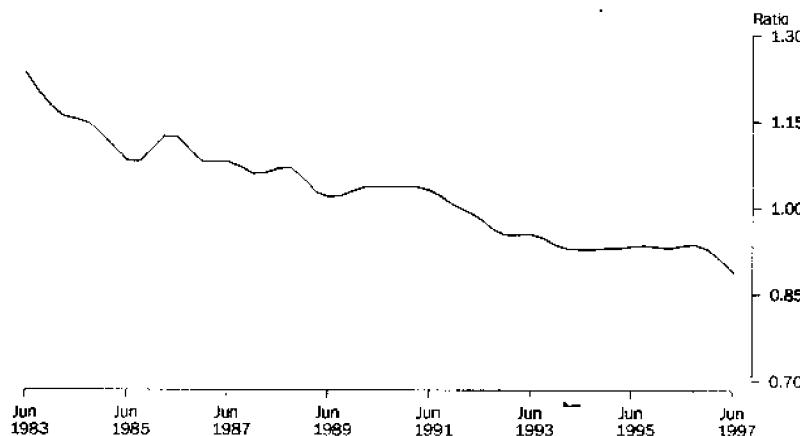

ANALYSES AND COMMENTS *continued*

PRIVATE NON-FARM STOCKS TO SALES RATIO

In trend current price terms, the book value of private non-farm stocks increased by \$124 million (0.2%) in the June quarter, while sales increased by \$2,071 million (2.6%). Consequently, the stocks to sales ratio fell from 0.909 in March quarter 1997 to 0.887. The following graph presents the ratio of private non-farm stocks to sales over the last fourteen years (see Explanatory Notes, paragraph 24).

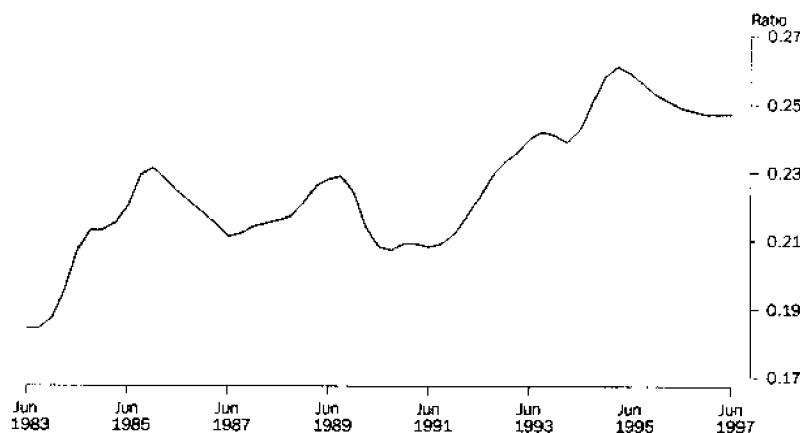

Trend at Current Prices

IMPORTS TO SALES RATIO

The imports to sales ratio, trended and at current prices, remained steady at 0.247 in the June quarter. After peaking at 0.261 in March quarter 1995, this ratio has since declined, reaching its current value in December quarter 1996. The following graph presents the ratio of imports to sales over the last fourteen years (see Explanatory Notes, paragraph 25).

Trend at Current Prices

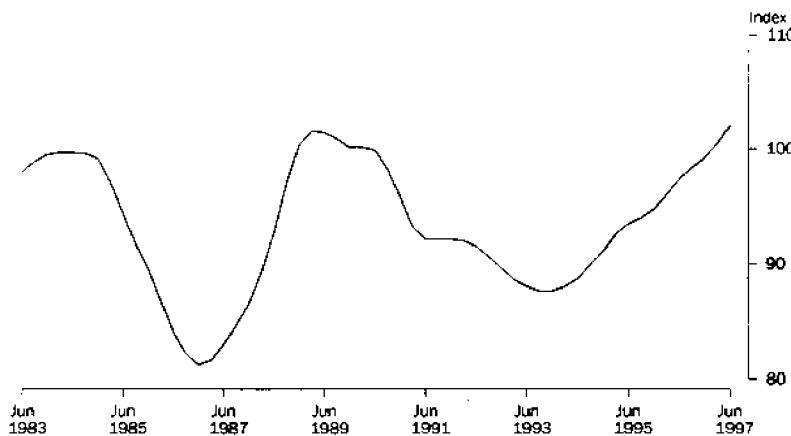

ANALYSES AND COMMENTS *continued*

TERMS OF TRADE

In June quarter 1997 the terms of trade index derived from trend estimates (see Explanatory Notes, paragraph 16) rose by 1.6%. The implicit price deflator for exports rose by 0.6%, while the deflator for imports fell by 0.9%.

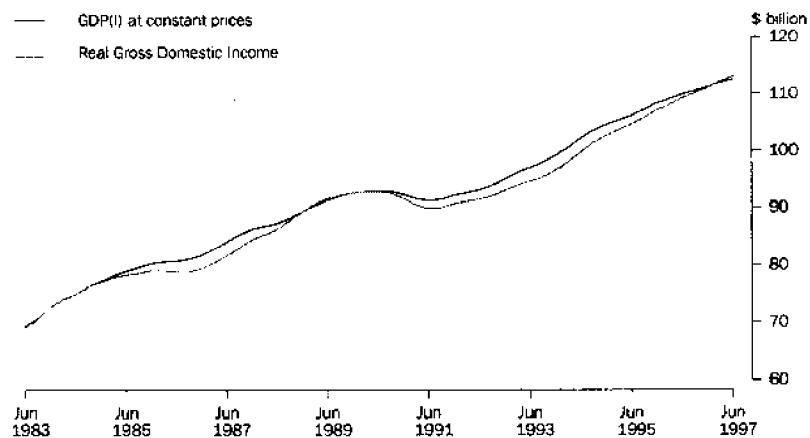

Trend (1989-90 = 100)

REAL GROSS DOMESTIC INCOME

GDP at constant prices is a measure of the volume of goods and services produced in Australia. If the terms of trade change significantly over the period of comparison, then this measure of real GDP will not accurately reflect the change in real purchasing power of the income generated by domestic production. (See the Technical Note included in the September quarter 1993 issue of this publication for a more detailed discussion.) A better measure of the real purchasing power of income generated by domestic production is GDP(I) at average 1989-90 prices adjusted for the terms of trade effect, which is referred to as *real gross domestic income*. The graph below provides a comparison of trend GDP(I) at average 1989-90 prices and real gross domestic income. Trend and seasonally adjusted estimates of real gross domestic income are shown in Tables 68 and 69 respectively.

Trend

ANALYSES AND COMMENTS *continued*

PRIVATE GROSS FIXED CAPITAL EXPENDITURE— NON-DWELLING CONSTRUCTION AND EQUIPMENT

Movements in private gross fixed capital expenditure can often be affected by large second-hand transactions and large one-off purchases. Second-hand purchases for both non-dwelling construction and equipment were boosted in June quarter 1997, because of the sale by the Victorian Government of its remaining 49% share in the Loy Yang B power station. The fall in new construction work done in the June quarter 1997 shown in the table below, should be interpreted in the light of the high level of construction activity in March quarter 1997 which was boosted by work on the Crown Casino in Melbourne and projects associated with the 2000 Olympics in Sydney.

BUSINESS INVESTMENT AT AVERAGE 1989-90 PRICES

	NON-DWELLING CONSTRUCTION.....			EQUIPMENT.....		
	New work done - private	Net second-hand purchases from public sector	Total	New assets purchased - private	Net second-hand purchases from the public sector	Total
	\$ million	\$ million	\$ million	\$ million	\$ million	\$ million

ANALYSES AND COMMENTS *continued*

EXPORTS OF GOODS AND SERVICES

Two large irregular transactions, relating to gold sales by the Reserve Bank of Australia (RBA) and the export of a frigate to New Zealand, are included in exports of goods and services (in both original and seasonally adjusted terms) in June quarter 1997.

In the domestic production account, the contribution to GDP from the gold sales is exactly offset by a reduction in other public authority stocks. Similarly, the value of the frigate exported to New Zealand in June quarter 1997 is offset by a reduction in other public authority stocks. The construction of the frigate, which was built for export to New Zealand, took several years to complete. The value of this construction activity in previous quarters has been included as increases in other public authority stocks in the quarters in which the work took place.

In line with the treatment adopted in *Balance of Payments, Australia* (5302.0) and *International Trade in Goods and Services, Australia* (5368.0), these transactions in June quarter 1997 have been treated as extreme irregulars in the exports of goods and services series. The same treatment has been adopted in relation to their contribution to the other public authority stocks series. Consequently, the values of these transactions in June quarter 1997 are included in seasonally adjusted estimates of exports and other public authority stocks (although without the application of the normal seasonal factors), but they have been excluded from the derivation of trend estimates.

For further information about the treatment of RBA gold transactions in ABS statistics please refer to the Technical Notes on page 18 of the June 1997 issue of 5368.0 or on page 8 of the June quarter 1997 issue of 5302.0.

PRIVATE NON-FARM STOCKS

There was a build-up in private non-farm stocks at constant prices in the June quarter 1997 which was mainly attributable to wholesale trade. The following table shows the industry composition for the increase in private non-farm stocks in seasonally adjusted constant price terms for the last five quarters.

INCREASE IN PRIVATE NON-FARM STOCKS AT AVERAGE 1989–90 PRICES—SEASONALLY ADJUSTED

	Jun Qtr 1996	Sep Qtr 1996	Dec Qtr 1996	Mar Qtr 1997	Jun Qtr 1997
	\$m	\$m	\$m	\$m	\$m
Manufacturing	247	309	119	-306	-417
Wholesale trade	537	57	-107	-570	657
Retail trade	-247	258	177	88	93
Other (including mining)	203	253	177	-84	295
Total	740	877	366	-872	628

INDUSTRY ESTIMATES OF GDP(P)

GDP(P) was much more affected by the improvements to source data mentioned in *Changes in this issue* than either GDP(I) or GDP(E), with the estimates for most industries being changed. The growth rates of most industries were boosted through the early 1990s to 1994-95 and reduced a little in subsequent periods. In addition, revisions have occurred as a result of the availability of firmer data. Manufacturing was the industry most affected, with the introduction of annual benchmarks for 1995-96 boosting growth.

ANALYSES AND COMMENTS *continued*

SEASONAL REANALYSES

As discussed under *Changes in this issue* on page 2, improved data from a number of ABS surveys have been used to compile the estimates in this issue of the quarterly national accounts, resulting in revisions over many years. Consequently, the following aggregates which are affected by these revisions have been seasonally reanalysed:

- Wages, salaries and supplements
- Goods components of private final consumption expenditure
- Private gross fixed capital expenditure on equipment
- Increase in private non-farm stocks
- Gross product at constant prices for most industries

Three other series (indirect taxes less subsidies, gross operating surplus — dwellings owned by persons, and household income from dwelling rent) were seasonally reanalysed because of revisions over recent years which involved a significant change to the seasonal pattern for payments of local government rates.

WAGES, SALARIES AND SUPPLEMENTS

Estimates of wages and salaries have been revised for all quarters from September quarter 1985 as a consequence of the improvements to the coverage of the Survey of Employment and Earnings which were outlined in the ABS Information Paper *Improvements to ABS Economic Statistics, 1997* (1357.0). In addition, minor changes to the compilation methodology have been implemented to make the estimates more consistent over the whole time series.

Quarterly movements in wages, salaries and supplements can at times be significantly affected by changes in two of the component series: severance, termination and redundancy payments, and supplements to wages and salaries (i.e. employers' contributions to superannuation and workers' compensation claims). Severance, termination and redundancy payments for recent quarters are shown below (although an estimate for June quarter 1997 is not yet available separately from the total wages and salaries figure) together with estimates for supplements for the last nine quarters. (The estimates can be shown only in original terms because wages, salaries and supplements are seasonally adjusted in total.)

GDP(P) market sector	0.1	-0.2	0.1	0.5	1.0	1.6	1.1	0.8	0.4	0.3	0.7	0.8	2.3
GDP(P) non-farm market sector	0.7	0.2	—	0.3	0.8	1.4	1.3	0.4	0.2	0.3	0.8	1.1	2.4

(a) Import duties have been added and the imputed bank service charge associated with this sector has been deducted to derive these estimates. (b) ANZSIC divisions A to K and P. See paragraph 21 of the *Explanatory notes*.(c) ANZSIC divisions B to K and P. See paragraph 22 of the *Explanatory notes*. (d) For the non-market industries the methods used to estimate gross product at constant prices do not adequately capture the changes in gross product per unit of labour input. See paragraph 21 of the *Explanatory notes*. Hence the estimates for the market and non-farm market sectors provide more useful indicators of changes in labour productivity than the estimates for all industries. (e) The seasonally adjusted estimates of hours worked have a history of substantial volatility, and so the most recent trend estimates are subject to revision when seasonally adjusted data for subsequent quarters become available.

Note: Annual data derived from original series. (a) Import duties have been added and the imputed bank service charge associated with this sector has been deducted to derive these estimates. (b) ANZSIC divisions A to K and P. See paragraph 21 of the *Explanatory notes*. (c) ANZSIC divisions B to K and P. See paragraph 22 of the *Explanatory notes*. (d) For the non-market estimates the methods used to estimate gross product at constant prices do not adequately capture the changes in gross product per unit of labour input. See paragraph 21 of the *Explanatory notes*. Hence the estimates for the market and non-farm market sectors provide more useful indicators of changes in labour productivity than the estimates for all industries.

TABLE 50 — GROSS DOMESTIC PRODUCT AT AVERAGE 1989-90 PRICES PER UNIT OF LABOUR INPUT
TREND—continued
 $(1989-90 = 100.0)$

June	121.8	122.1	120.8	120.6	106.6	100.7	100.6	114.3	114.5	120.0	119.9	

Note: Annual data derived from original series. (a) Import duties have been added and the imputed bank service charge associated with this sector has been deducted to derive these estimates. (b) ANZSIC divisions A to K and P. See paragraph 21 of the *Explanatory notes*. (c) ANZSIC divisions B to K and P. See paragraph 22 of the *Explanatory notes*. (d) For the non-market industries the methods used to estimate gross product at constant prices do not adequately capture the changes in gross product per unit of labour input. See paragraph 23 of the *Explanatory notes*. Hence the estimates for the market and non-farm market sectors provide more useful indicators of changes in labour productivity than the estimates for all industries. (e) The seasonally adjusted estimates of hours worked have a history of substantial volatility, and so the most recent trend estimate are subject to revision when seasonally adjusted data for subsequent quarters become available.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains estimates of the components of gross domestic product and national expenditure and supporting tables for the latest quarter, together with comparative estimates for the eight previous quarters and the last four financial years. Seasonally adjusted and trend estimates of the major aggregates and some selected series are also provided for the latest quarter, together with comparative estimates for the twelve previous quarters. The List of tables, pages 13–14, show the full range of data provided.

CONCEPTS, SOURCES AND METHODS

2 These are documented in *Australian National Accounts: Concepts, Sources and Methods* (5216.0). An updated version of the 5216.0 publication, along with other similar ABS publications, is now available on a CD-ROM product, which is entitled *Statistical Concepts Reference Library on CD-ROM* (1361.0). It was released in July 1996.

ACCURACY OF QUARTERLY ESTIMATES

3 Estimating for a period of less than one year presents special problems. It is often difficult to adhere strictly to definitions used in annual estimates when deriving quarterly ones. This is particularly the case for the quarterly measure of income, because it is not always possible to match the value of production for a quarter with the cost incurred in that production. Difficulties are also encountered in obtaining detailed data for short periods and in preparing consistent estimates from different sources with different accounting procedures and periods. Furthermore, the quarter-to-quarter growth in seasonally adjusted terms is very sensitive to the timing of recording a transaction. If the recording of a transaction is delayed by one quarter, seasonally adjusted movements will be distorted for three consecutive quarters. All these problems affect the accuracy of the current and constant price estimates and should be taken into account in interpreting the estimates.

REVISIONS

4 Most figures are subject to revision as more complete and accurate information becomes available. The revisions are of two types: those made to recent quarters and those made as a consequence of a redistribution across all quarters within a year following revisions to annual totals. Major revisions made this quarter are discussed on page 2.

TREND ESTIMATES

5 Given the qualifications regarding the accuracy and reliability of the quarterly national accounts, the Australian Bureau of Statistics (ABS) considers that trend estimates provide the best guide to the underlying movements, and are more suitable than either the seasonally adjusted or original data for most business decisions and policy advice.

6 A trend estimate is obtained by removing the irregular component from the seasonally adjusted series. For estimates in this publication, it is calculated using a centred 7-term Henderson moving average of the seasonally adjusted series. Estimates for the three most recent quarters cannot be calculated using this centred average method; instead an asymmetric average is used. This can lead to revisions in the trend estimates for the last three quarters when data become available for later quarters, even if none of the original data for earlier quarters has changed.

7 If a series has a high 'irregular' component, then the trend estimates will be subject to greater revision for the latest few quarters as data become available for subsequent quarters than would otherwise be the case. However, it is important to note that this does not make the trend series inferior to the seasonally adjusted or original series. In fact, in such cases the effect of the irregular component on overall movements is likely to be even more marked in the seasonally adjusted and the original estimates than in the trend series.

EXPLANATORY NOTES

TREND ESTIMATES *continued*

8 For more information about ABS procedures for deriving trend estimates and an analysis of the advantages of using them over alternative techniques for monitoring trends, see *A Guide to Interpreting Time Series — Monitoring Trends: an Overview* (1348.0) or contact the Assistant Director, Time Series Analysis on (06) 252 6345.

Two feature articles which have appeared in the ABS monthly publication *Australian Economic Indicators* (1350.0) may also be of interest:

- *Picking Turning Points in the Economy* (April 1991), and
- *Smarter Data Use* (March 1992).

IMPLICIT PRICE DEFULATOR (IPD)

9 The quarterly implicit price deflators (IPDs) are derived by dividing seasonally adjusted and trend current price estimates by the corresponding constant price estimates.

Movements in IPDs can be greatly affected by changes in the physical composition of the aggregates and their components. For this reason, quarterly IPDs derived from seasonally adjusted or trend data are preferred to those using original data. The seasonal adjustment process itself is also a possible source of distortion. For further information see Appendix VI of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

SEASONAL ADJUSTMENT:

GENERAL METHOD

10 Data that are affected by seasonal factors are adjusted to remove the effects of these factors. The general methods for doing so are described in Appendix I of *Australian National Accounts: Concepts, Sources and Methods* (5216.0). Three important points should be noted here:

- The methods used in seasonal adjustment do not force the sum of the adjusted estimates for each quarter of a year to equal the original annual total.
- Where constant price estimates have no apparent seasonality in their implicit price deflators, the estimates are adjusted using the corresponding factors for current price estimates.
- Special methods have been used to adjust some components of gross farm product. These concern the adjustment of crop production where production/harvest only occurs in a couple of quarters each year. In these instances, the output for each financial year is distributed equally over the four quarters.

MEASURES OF GDP

GDP(I) INCOME APPROACH

11 GDP(I) is the sum of factor incomes, consumption of fixed capital (depreciation) and net indirect taxes. The preferred current price measure of GDP is GDP(I). It is the overall measure which is consistent with subsidiary measures such as national income and the other consolidated tables (such as the national income and outlay account). GDP(I) also provides the base year benchmarks for the constant price estimates of GDP(P). Constant price estimates of GDP(I) are derived by deflating current price estimates of GDP(I) by the implicit price deflator of GDP(E).

GDP(E) EXPENDITURE APPROACH

12 GDP(E) is the sum of all final expenditures, changes in stocks, and exports less imports. Constant price estimates of GDP(E) are the sum of all these components at average 1989–90 prices.

GDP(P) PRODUCTION APPROACH

13 GDP(P) is calculated as the market value of goods and services produced by an industry (i.e. gross output) less the cost of goods and services used in the productive process (i.e. intermediate consumption). Constant price estimates of GDP(P) are the sum of constant price estimates (at average 1989–90 prices) for each industry.

EXPLANATORY NOTES

MEASURES OF GDP *continued*

GDP(A) **14** While the three measures above are identical in concept, they can differ significantly in practice, especially in the short term, because of the different data sources used for each measure. Using the average of the three, GDP(A), smooths out these differences. GDP(A) is considered by the ABS to be the most satisfactory indicator of short-term seasonally adjusted or trend growth (see the Feature Article in the June quarter 1990 issue of *Australian National Accounts: National Income and Expenditure* (5206.0)).

ANALYSIS OF CONTRIBUTIONS TO GROWTH

15 Tables 6 and 7 present analyses of the contribution provided by each major component to the percentage change in trend and seasonally adjusted estimates of constant price GDP(I). The figures in each table are additive within each quarter, unlike the percentage changes shown in other tables in this publication. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100$$

where

- $A(t)$ = value of aggregate A in quarter under consideration
 $A(t-1)$ = value of aggregate A in preceding quarter
 $GDP(t-1)$ = value of GDP in preceding quarter.

TERMS OF TRADE

16 There are several ways of measuring the terms of trade. In this publication, the following index is used:

$$\frac{\text{Implicit price deflator for exports of goods and services}}{\text{Implicit price deflator for imports of goods and services}} \times 100$$

Estimates of the terms of trade are shown in Tables 11, 12, 18, 19, 68 and 69.

REAL GROSS DOMESTIC INCOME

17 GDP at constant prices is a measure of the volume of goods and services produced in Australia. If the terms of trade change significantly over the period of comparison, then this measure of real GDP will not accurately reflect the change in real purchasing power of the income generated by domestic production. (See the *Technical Note* included in the September 1993 issue of this publication for a more detailed discussion.) A better measure of the real purchasing power of income generated by domestic production is GDP(I) at average 1989–90 prices adjusted for the terms of trade effect, which is referred to as *real gross domestic income* (or real GDI). The following adjustment is made to GDP(I) at constant prices to obtain an estimate of real GDI:

- exports of goods and services at current prices are deflated by the implicit price deflator for imports of goods and services
- the actual constant price value of exports is then deducted from this value, and
- the resultant terms of trade adjustment is then added to GDP(I) at constant prices to give real GDI presented in Tables 68 and 69.

EXPLANATORY NOTES

GROSS PRODUCT PER UNIT OF LABOUR INPUT

18 Indexes of constant price gross product per person employed and per hour worked are commonly referred to as measures of labour productivity. However, it should be noted that these indexes reflect not only the contribution of labour to changes in product per unit of labour, but also the contribution of capital and other factors (such as managerial efficiency, economies of scale, etc.).

19 When analysing labour productivity indexes it is critical to note that they are subject to the vagaries of the growth (or business) cycle as well as the effects of any measurement error in either output or labour input. Differences in the amplitude and phase of the output and input cycles can result in labour productivity indexes deviating substantially from their longer-term trend. Analytical work undertaken within the ABS suggests that movements in employment and hours worked tend to lag movements in GDP. Over a 20 year period, the lag at turning points in the growth cycle varied between zero and four quarters, with the average being between two and three quarters. The implication is that, in the period of the growth cycle when the growth in output is declining, indexes of labour productivity are likely to decline, particularly if rapid growth in GDP is abruptly ended. Conversely, labour productivity indexes are likely to grow strongly when the economy comes out of a cyclical trough.

20 A simple way to estimate the underlying trend in labour productivity is to compare the values of a labour productivity index spanning a growth cycle e.g. from the peak of one growth cycle to the peak of another. Note that such estimates rest on the assumption that labour is being utilised to the same degree at each growth cycle peak. Average annual growth rates, over growth cycles, of estimates of gross product per hour worked in the *market* and *non-farm market* sectors are shown in *Australian National Accounts: Multifactor Productivity* (5234.0).

MARKET AND NON-FARM MARKET SECTORS

21 The estimates of gross product at constant prices for five industries: Property and business services; Government administration and defence; Education; Health and community services; and Personal and other services are derived either wholly or primarily by using either deflated input cost data or hours worked as indicators of output. As such, the estimates cannot adequately reflect changes in productivity. For the purpose of measuring changes in productivity, it is therefore preferable that these industries be excluded. The constant price product of a group of industries referred to as the *market sector* is defined to be GDP(P) *less* the above six industries, *less* Ownership of dwellings (for which capital stock is used as the indicator of output), *plus* the imputed bank service charge related to the 'non-market' industries.

22 A second industry group, referred to as the *non-farm market sector*, comprises the market sector *less* Agriculture, forestry and fishing. Productivity estimates derived for this group are free of the effects caused by the volatility of agricultural production due to changing seasonal conditions.

INDEXES OF EMPLOYMENT AND HOURS WORKED

23 The quarterly employment indexes used to derive the gross product per person employed indexes comprise all labour engaged in the production of goods and services and include not only civilian wage and salary earners but also employers; self-employed persons; persons working one hour or more without pay in a family business or on a farm; and members of the Australian defence forces. For details of how the employment and hours worked estimates are formed, refer to Section 23 of *Australian National Accounts: Concepts Sources and Methods* (5216.0), and also Section 4 of the Information Paper *Australian National Accounts: Introduction of Constant Price Estimates at Average 1989-90 Prices* (5243.0) which describes changes in methods introduced in conjunction with the rebase of constant price estimates to average 1989-90 prices.

EXPLANATORY NOTES

PRIVATE NON-FARM STOCKS
TO SALES RATIO

24 The ratio is presented in tables 68 and 69. The denominator of this ratio, in current price terms, is defined as :

- private final consumption expenditure on goods
- *plus* private gross fixed capital expenditure on dwellings, non-dwelling construction and equipment
- *plus* public gross fixed capital expenditure
- *plus* exports of non-rural goods.

IMPORTS TO SALES RATIO

25 The ratio is merchandise imports (ie total imports of goods) to sales (as defined in paragraph 24 above). This ratio is presented in tables 68 and 69.

HOUSEHOLD SAVING RATIO

26 This is the ratio of household saving to household disposable income, where household saving is the difference between household disposable income and private final consumption expenditure. The ratio is a memorandum item in tables 27 and 28 and is also shown in table 67.

GDP(A) PER CAPITA

27 This is the ratio of GDP(A) to an estimate of the resident Australian population. For all but the most recent quarters, the resident population data are drawn from *Australian Demographic Statistics* (3101.0). For the most recent quarters, estimates are made by extrapolating from the latest available data.

DATA ON FLOPPY DISK

28 All quarterly series in this publication are available in spreadsheet format on floppy disk, *Australian National Accounts: Quarterly Data on Floppy Disk* (5228.0). These data generally run from September quarter 1959. An important exception is GDP(P) and its components which run from September quarter 1974. The cost is currently \$130.00 per release or \$390.00 for an annual subscription. Place your order by ringing (06) 252 6627.

TECHNICAL NOTES

FINANCE AND INSURANCE—NEW CONSTANT PRICE METHODS

INTRODUCTION

- 1** The constant price estimates of gross product for the finance and insurance industry and the imputed bank service charge (IBSC) have been replaced in this issue with new estimates derived using a completely different method. The new estimates show substantially higher growth than those previously published, and although increases in the gross product of the industry are partially offset by increases in the imputed bank service charge, there is a significant net upward revision in the production-based measure of GDP, GDP(P), over the last decade. As well as changes to GDP(P), there are smaller changes to the expenditure-based and income-based measures of GDP, GDP(E) and GDP(I), as a consequence of carrying through the change of method for estimating GDP(P) to counterpart items of final expenditure.
- 2** In the past, constant price estimates of gross product for the finance and insurance industry were calculated by taking the base year (currently 1989–90) value of the industry's contribution to GDP(I) and extrapolating it using total hours worked. This approach rests on the assumption that production in real terms is proportional to the number of hours worked by employees in the industry. In effect, it assumes that labour productivity is constant. The approach does not make allowance for increases in output growth that may have occurred as a result of changes in capital intensity or improvements in productivity arising from technological, organisational and other changes over time. The assumption of no change in labour productivity also underlaid the constant price estimates of the IBSC.
- 3** The new method involves estimating constant price gross output for the major constituent industries within the finance and insurance industry, using output indicators. As with most other industries, it is assumed that constant price gross product is a fixed proportion of constant price gross output, and so the constant price estimates of gross product are derived by extrapolating the base year current price estimates of gross product with the constant price estimates of gross output. While suitable output indicators have been derived for all the major constituent industries, there are several industries where this has not been possible. Measures for these latter industries will be developed as more extensive administrative and survey data become available. While the new estimates fall well short of perfection, they are of similar quality to those of most other industries. The new estimates imply growth of around 43% in labour productivity over the last decade (an average annual growth rate of 3.6%). Given the extent of technological and organisational change in the industry, this appears far more plausible than the zero growth implied by the previous estimates.
- 4** In the past, constant price estimates of private final consumption expenditure on financial and insurance services and exports of financial and insurance services were derived by deflating the corresponding current price estimates with a combination of relevant elemental indexes from the CPI and input cost indexes derived from wage rate and price indexes relating to intermediate inputs. The new constant price expenditure estimates are derived using a combination of price indexes and volume indicators consistent with the derivation of the new output measures.

ESTIMATION OF PRODUCTION

- 5** As noted above, the new estimates rest on the assumption that in constant price terms the gross product of the finance and insurance industry is a fixed proportion of gross output. From this assumption it follows that a volume measure, or measures, of gross output can be used to extrapolate current price estimates of gross product in the base period and thereby derive constant price estimates of gross product.

TECHNICAL NOTES

FINANCE AND INSURANCE—NEW CONSTANT PRICE METHODS

ESTIMATION OF PRODUCTION continued

6 For the finance and insurance industry a five stage process is employed. First, annual constant price estimates of output are derived by extrapolating base year (1989–90) current price estimates of output using volume indicators of output. Second, these are summed within four industry groups—banking, non-bank finance, insurance and share broking. Third, the aggregate annual constant price estimates of output for each of these four industry groups is used to extrapolate the base year current price estimate of gross product for that group, which are based on data from the 1989–90 issue of *Australian National Accounts: Input-Output Tables* (5209.0). Fourth, these group estimates are summed for each year and used to extrapolate the base year current price estimate of gross product for the entire industry in the national, income and expenditure accounts. Fifth, quarterly estimates of gross product for finance are derived by interpolating and extrapolating the annual constant price estimates of gross product with quarterly movements in the real assets of banks. In the absence of suitable quarterly data for insurance, quarterly estimates are derived using a mathematical trend interpolation and extrapolation procedure. Quarterly constant price private final consumption expenditure on share broking services is the indicator used for interpolating and extrapolating the annual estimates for share broking.

7 Details of the procedures used in the first stage of the above process to derive annual constant price estimates of output for the constituent industries within the finance and insurance industry (as defined in the *Australian and New Zealand Industrial Classification, 1993 (ANZSIC)* (1292.0)) are as follows:

FINANCE **8** *Central Bank and Deposit Taking Financiers (ANZSIC groups 731 and 732)* These ANZSIC groups comprise the RBA, banks, credit unions, building societies, money market dealers and other deposit taking financiers. Together they account for almost half of the production of the finance and insurance industry. The output of the groups can be classified into two components. The first component is indirectly measured, and, in global terms, is equal to interest receipts less interest payments. The second component is directly measured and is equal to income earned from direct charges.

9 Banks and other deposit taking institutions earn much of their income by charging their borrowers a higher rate of interest than they pay to depositors. The interest rate margin constitutes the price of financial intermediation. It is assumed that half of the interest rate margin is charged to borrowers and the other half is charged to depositors. Constant price estimates of the indirectly measured component are then derived for each year by multiplying the borrowers' margin in the base year (1989–90) by a real measure of loans outstanding and by multiplying the depositors' margin in the base year by a real measure of deposits. The resulting estimates of real interest paid by borrowers and depositors are then summed. The real estimates of loans and deposits are derived by deflating the current price values with the implicit price deflator (IPD) of domestic final demand.

TECHNICAL NOTES

FINANCE AND INSURANCE—NEW CONSTANT PRICE METHODS

ESTIMATION OF PRODUCTION *continued*

10 Constant price estimates of direct, or explicit, service charges are constructed by deflating the current price value by an IPD derived from a sample of direct charge products for which explicit fees are charged. Constant price estimates in respect of the basket of services incorporated within the sample are derived by moving forward the base year estimates in accordance with the movement of quantity indicators relevant to those individual services. For example, constant price estimates of establishment fees for home mortgages are derived using the number of secured housing commitments. The current and constant price values derived in respect of the sample of services are used to derive an IPD. This IPD is then applied to the total current price value for all directly charged services to yield a constant price estimate of output.

11 *Other Financiers and Financial Asset Investors (ANZSIC groups 733 and 734)* Constant price estimates are not derived for other financiers and financial asset investors. In effect, it is assumed that their gross product grows at the same rate as the rest of the non-bank finance industry group.

12 These two ANZSIC groups are relatively heterogeneous and it has not been possible to compile satisfactory output indicators at the present time.

13 *Imputed Bank Service Charge (IBSC), the nominal industry* The current price values of the IBSC are deflated with the IPD of the indirectly charged output of the finance industry.

INSURANCE **14** *Life Insurance and Superannuation Funds (ANZSIC group 741)* Constant price estimates of the output of the life insurance industry are derived by extrapolating the current price estimate in the base year by the number of policies in force.

15 Due to a paucity of suitable data, it is assumed that the output of the superannuation funds industry changes at the same rate as the output of the life insurance industry. This is unsatisfactory, but it should be borne in mind that, as currently measured, the output of the superannuation funds industry is quite small compared with that of the life insurance industry. This is because the output of life and superannuation funds at current prices is valued as the sum of an imputed service charge and gross rent (from buildings and properties other than land). The service charge is calculated as being equal to administration expenses, which are relatively small for superannuation funds. Also, superannuation business conducted by life insurance companies is included in the measured output of the life insurance industry.

16 *Other Insurance (ANZSIC group 742)* The general approach is to extrapolate the current price estimate of output for a particular type of business in the base year by constant price estimates of the premiums paid. In the case of general insurance, separate estimates for the private and public sectors are derived for each type of business.

17 The constant price value of health insurance premiums is calculated by deflating premiums paid with the CPI for health and personal care insurance. For general insurance, premiums paid for the various types of business are deflated with price indexes relating to the items insured. It is assumed that the insurance service charge included in premiums is a constant proportion of premiums and that the price of the insurance service moves in proportion to the price of the items insured.

TECHNICAL NOTES

FINANCE AND INSURANCE—NEW CONSTANT PRICE METHODS

ESTIMATION OF PRODUCTION *continued*

18 The current price value of general insurance output is defined to be premiums less claims. Output can therefore be quite erratic due to fluctuations in claims. Unlike the current price estimates, the constant price estimates of output are unaffected by annual fluctuations in the value of claims and they are relatively stable. The approach implies that any erratic movements in the current price series are the result of price movements rather than of changes in the real value of services produced, and that fluctuations in the level of claims do not affect the volume of services delivered.

19 *Services to Finance and Investment (ANZSIC group 751)* The current price estimates of output of share brokers is deflated with the All Ordinaries Share Price Index (AOSPI).

20 It is assumed that the constant price gross product of other services to the finance and insurance industry grow at the same rate as the rest of the finance and insurance industry.

ESTIMATION OF FINAL EXPENDITURE

21 The general approach is to use methods consistent with the corresponding production items.

22 For private final consumption expenditure, the constant price estimates of expenditures on financial services are derived by deflating the current price estimates with output IPDs, such as that for financial intermediation. Current price estimates of expenditures on share broking services are deflated with the AOSPI. The constant price values of premiums for those types of insurance business relevant to consumers are used to extrapolate the base year current price values.

23 Exports of financial services, which are dominated by brokerage, are deflated with the AOSPI. Constant price estimates of exports of insurance services are derived by deflating a current price estimate of the insurance service charge for exports with a price index for insurance premiums, and using the resulting constant price estimates to extrapolate the current price estimate of exports of insurance services in the base year.

FOR MORE INFORMATION...

The ABS publishes a wide range of information on Australia's economic and social conditions. A catalogue of publications and products is available from any of our offices (see below).

INFORMATION CONSULTANCY SERVICES

Information tailored to special needs of clients can be obtained from the Information Consultancy Service available at ABS Offices (see below).

ABS PRODUCTS

A large number of ABS products is available from the ABS Bookshops (see below). The ABS also provides a subscription service – you can telephone the ABS Subscription Service Australia wide toll free on 1800 0206 08.

ELECTRONIC SERVICES

A large range of data is available via on-line services, diskette, magnetic tape, tape cartridge and CD ROM. For more details about our electronic data services, contact any ABS office (see below) or e-mail us at:
