(b) Includes Other Territories comprising Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.

KEY POINTS

ESTIMATED RESIDENT POPULATION

- The preliminary estimated resident population (ERP) of Australia at September 2004 was 20,168,900 persons, an increase of 236,700 persons since September 2003 and 57,600 persons since June 2004.
- Preliminary natural increase during the September quarter 2004 was 29,100 persons.
- Preliminary net overseas migration during the September quarter was 28,400, a decrease of 10% on the September quarter 2003.

POPULATION GROWTH RATES

- The Australian population grew 0.3% during the September quarter 2004 and 1.2% during the 12 months ended September 2004.
- During the September quarter 2004 all states and the Northern Territory experienced positive population growth, while the Australian Capital Territory remained relatively unchanged.

FEATURE ARTICLES

- At 30 June 2003, an estimated 23% of the Australian population were born overseas. Those born in the United Kingdom were the largest overseas born group (1.1 million), followed by those born in New Zealand (428,000), Italy (231,600), Viet Nam (174,600) and China (173,100).
- In 2003 there were 106,400 marriages registered and 53,100 divorces granted in Australia. This represents an increase of 960 marriages (1%) and a decrease of 860 divorces (2%) on numbers recorded in 2002.

INTRODUCTION

Estimated resident population (ERP) data in this publication are based on the 2001 Census of Population and Housing. Exceptions are tables 17, 18 and 19 (excluding 2001 estimates), which are based on the 1996 Census of Population and Housing.

CHANGES IN THIS ISSUE

The layout and content of this publication has changed. The major changes are detailed below.

- A feature article, *Population by Country of Birth* (page 7) has been included in this issue. Table 20 accompanies this feature article and includes previously unpublished data for 30 June 2003 on ERP by country of birth.
- A feature article, *Marriages and Divorces, Australia 2003* (page 9) has been included in this issue. Tables 21 and 22 accompany this feature article and include statistics of marriages and divorces for 2003 and earlier years.
- Table 5 includes preliminary ERP at 30 June 2004.

Revisions included in this issue are as follows:

- Population estimates for Capital City Statistical Divisions and selected Statistical Districts are now based on the *2004 Australian Standard Geographical Classification* (cat. no. 1216.0). See Table 5 in this issue.
- The propensities for changes in travel behaviour in Table 2 of the *Technical Note – Measuring Net Overseas Migration* have been revised and applied to the September quarter 2004. The impact of this revision on earlier quarters is being evaluated.

ERP DATA STATUS

At any point in time this publication contains final, revised and preliminary ERP data. The status of the ERP data included in this issue is as follows:

- Final – All ERP data up to and including June quarter 2001
- Revised – ERP data from September quarter 2001 to June quarter 2003, inclusive
- Preliminary – ERP data from September quarter 2003 to September quarter 2004, inclusive.

NORTHERN TERRITORY BIRTHS

September quarter 2004 birth registrations for the Northern Territory appear to be lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.

DATA NOT YET AVAILABLE

Household estimates for 2002 and 2003 in tables 17, 18 and 19 are currently under review.

MAIN FEATURES

INTRODUCTION

The preliminary estimated resident population (ERP) of Australia at September 2004 was 20,168,900 persons, an increase of 236,700 (1.2%) since September 2003 and 57,600 (0.3%) since June 2004. During the September quarter 2004 the male population increased to over 10 million (10,024,300). The female population reached this milestone 12 months previously in the September quarter 2003.

COMPONENTS OF AUSTRALIA'S POPULATION CHANGE

The growth of Australia's population has two components: natural increase (the number of births minus the number of deaths) and net overseas migration (net permanent and long-term movement plus the migration adjustment).

Natural increase

Natural increase during the September quarter 2004 was 29,100 persons, contributing 51% to Australia's quarterly population growth. The number of births registered during the September quarter 2004 was 66,000, while the number of deaths registered was 36,900.

Natural increase for the year ended September 2004 was 122,100, representing an increase of 4% (or 4,300 persons) on the number recorded in the year ended September 2003. Births contributed 255,100 babies and deaths removed 133,000 persons from the population.

September quarter 2004 birth registrations for the Northern Territory appear to be lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.

Net overseas migration

During the September quarter 2004 net overseas migration (28,400 persons) contributed 49% to Australia's quarterly population growth. This was a decrease of 10% (or 3,100 persons) on the number recorded in September quarter 2003. During the September quarter 2004 there were 111,600 permanent and long-term arrivals and 83,200 permanent and long-term departures after migration adjustments.

The Australian Bureau of Statistics (ABS) applies a number of adjustments to the overseas arrivals and departures data used to produce estimates of net overseas migration (NOM). These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour, but (in the case of revised NOM estimates) also include adjustments to transform numbers of overseas movements into numbers of travellers. These are collectively referred to as 'migration adjustments'. For more information see the *Technical Note – Measuring Net Overseas Migration*.

STATES AND TERRITORIES

Population

The population of Australia's states and territories at September 2004 were as follows: New South Wales 6,744,400, Victoria 4,988,800, Queensland 3,899,600, South Australia 1,536,300, Western Australia 1,989,600, Tasmania 483,000, Northern Territory 200,400, and the Australian Capital Territory 324,000.

During the September quarter 2004 the Northern Territory's population passed 200,000 persons.

MAIN FEATURES *continued*

Population *continued*

Consistent with the amendments to the *Commonwealth Electoral Act 1918*, estimates of the population of each of the Other and External Territories are listed separately in table 7 of this publication. The populations of the Other Territories continue to be included in the Australian totals presented in other tables (see paragraph 2 of the Explanatory Notes).

Growth rates

Except for the Australian Capital Territory, all states and the Northern Territory recorded positive population growth during the September quarter 2004. Queensland recorded the highest growth (0.5%), followed by Western Australia (0.4%), Victoria and the Northern Territory (each 0.3%), New South Wales and Tasmania (each 0.2%), and South Australia (0.1%). The Australian Capital Territory remained relatively unchanged.

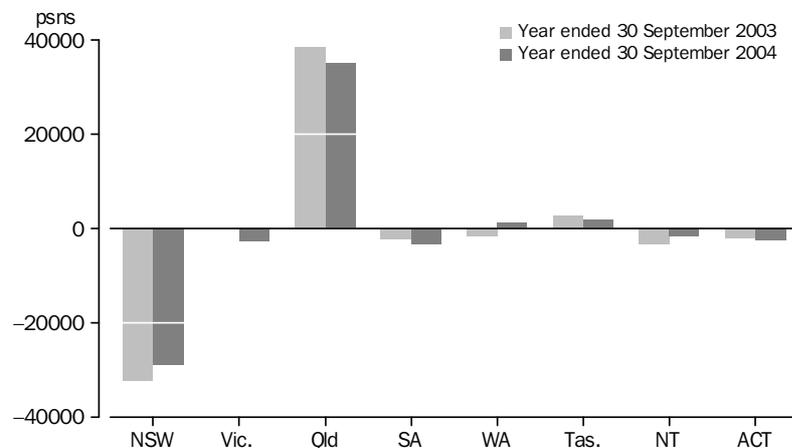

For the year ended September 2004 all states and territories recorded a positive growth rate. The highest growth was recorded by Queensland (2.1%), followed by Western Australia (1.6%) and Victoria (1.2%). The lowest growth rate was recorded by the Australian Capital Territory (0.3%).

Interstate migration

During the September 2004 quarter Queensland, Western Australia and Tasmania recorded net interstate migration gains, and the remaining states and territories recorded net losses. Interstate migration was the largest contributor (43%) to Queensland's quarterly population growth with a gain of 7,600 persons. Western Australia gained 290 persons and Tasmania gained 140 persons. New South Wales lost the largest number of persons through interstate migration (-6,000) followed by the Australian Capital Territory (-830), South Australia (-530), Victoria (-520) and the Northern Territory (-150).

A similar pattern is also reflected in the net interstate migration for the year ended September 2004, with net gains recorded for Queensland (35,100), Tasmania (1,800) and Western Australia (1,300) and losses recorded for New South Wales (-28,800), South Australia (-3,100), Victoria (-2,500), the Australian Capital Territory (-2,300) and the Northern Territory (-1,500).

NET INTERSTATE MIGRATION, States and territories

FEATURE ARTICLE 1

POPULATION BY COUNTRY OF BIRTH

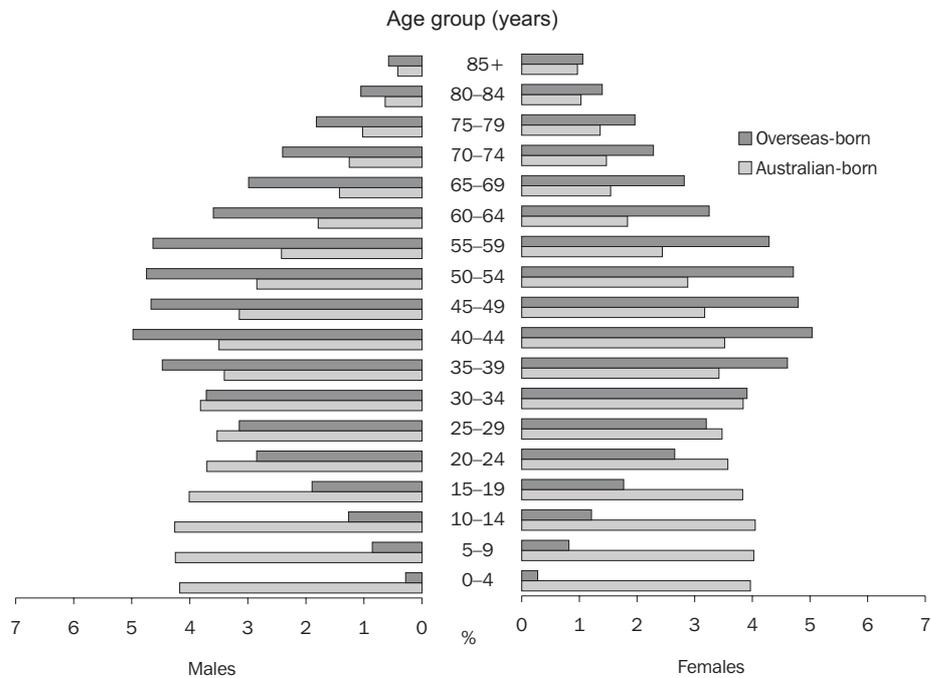

INTRODUCTION

Australia has a long history of overseas migration flows which has resulted in a consistently large proportion of residents having been born overseas. As at 30 June 2003, more than one in five (23%) persons resident in Australia were born overseas. Persons born in the United Kingdom continued to be the largest overseas-born group with 1.1 million residents in Australia, followed by those born in New Zealand (428,000), Italy (231,600), Viet Nam (174,600) and China (173,100).

AGE AND SEX

At 30 June 2003, the age distribution of overseas-born Australian residents was considerably older than that of the Australian-born population. This is to be expected as most people migrate as adults. Persons born in Australia comprised 95% of those aged under 15 years, 73% of those aged 15-64 and 66% of those aged 65 years and over.

AGE AND SEX, Australian-born and overseas-born populations—30 June 2003

Five per cent of the overseas-born population were aged under 15 years, compared with 25% of the Australian-born population. Some 77% of overseas-born Australian residents were aged in the prime working age-group of 15-64 years, compared with 64% of the Australian-born population. Also, 18% of overseas-born Australian residents were 65 years and over, while Australian-born residents in this age-group constituted 11% of the total Australian-born population.

Of the total male population in Australia aged 65 years and over, 36% were born overseas. Overseas-born females made up 31% of the total female population aged 65 years and over. The higher sex ratio for the older overseas born population is largely the result of male-dominated migration immediately following World War II.

AGE AND SEX *continued*

At 30 June 2003, the sex ratio for all Australian residents was 98.7, that is, for every 100 females, there were 98.7 males. The sex ratio varied for the significant overseas-born birthplace countries, with a low of 53.8 for the Philippines, China (89.7), the United Kingdom (102.8), Italy (110.6), to a high of 113.7 from India.

MEDIAN AGE, Sex Ratio and Population, Country of Birth—30 June 2003

Country of Birth (a)	Median Age	Sex Ratio(b)	ERP '000
South Africa	37.6	100.9	101.6
New Zealand	38.0	106.7	428.0
Viet Nam	39.0	93.9	174.6
Philippines	39.3	53.8	120.1
India	39.9	113.7	118.3
China	41.7	89.7	173.1
United Kingdom	52.9	102.8	1 126.2
Germany	56.8	95.2	116.6
Greece	61.0	102.1	130.0
Italy	63.4	110.6	231.6
Total Australian Residents	36.2	98.7	19 872.6

- (a) This is the top ten country of birth list of overseas-born Australian residents.
- (b) Number of males per 100 females.

At 30 June 2003, the median age of all Australian residents was 36.2 years. The youngest median age of the top ten source countries of overseas-born Australian residents was South Africa, at 37.6 years. The oldest group was born in Italy with a median age of 63.4 years. Australian residents from the country that supplied the highest number of overseas-born residents, the United Kingdom, had a median age of 52.9 years.

SOURCE COUNTRIES

In the period from 30 June 1998 to 30 June 2003, among the countries in table 20 (page 35), the South African born had the greatest rate of increase into Australia's estimated resident population. The average annual increase was 7.9% over this period with India having the next highest increase (5.8%). Other countries which have been growing quickly as countries of origin of Australian residents over this five-year period are New Zealand (with an average annual increase of 5.2%), China (5.1%) and South Korea (4.4%). These increases are mainly due to growth in permanent migration from these countries to Australia.

The United Kingdom remained the largest source of overseas-born people with over 1.1 million Australian residents having been born in that country. However, this number had decreased by 0.4% on average per year since 1998. Poland had the largest decrease as a birthplace of Australian residents in this five-year period of 1.9% averaged annually. This is largely the result of deaths among older Polish-born Australian residents.

FEATURE ARTICLE 2

MARRIAGES AND DIVORCES, AUSTRALIA 2003

INTRODUCTION

The following article and tables 21 and 22 in this publication are, in part, reprinted from the Main Features of *Marriages, Australia* (cat.no. 3306.0.55.001) and *Divorces, Australia* (cat.no. 3307.0.55.001). These products are now available from the ABS web site <<http://www.abs.gov.au>>.

MARRIAGES, AUSTRALIA

In 2003 there were 106,400 marriages registered in Australia, an increase of 960 when compared with 2002, and continuing the increase in the number of marriages since the low of 103,130 in 2001. While 2003 recorded an increase in the number of marriages registered, the crude marriage rate (per 1,000 of the population) stabilised at 5.4, the same rate as recorded for 2002. The crude marriage rate has been in decline for the last two decades, dropping from 7.5 in 1983 to 6.4 in 1993. Marriage rates (per 1,000 of unmarried population) have also continued to fall over the last two decades. In 1983 there were 55 marriages of males and 53 marriages of females, per 1,000 of the unmarried population of each respective sex. By 2001 this had fallen to 31 for males and 28 for females.

TOTAL MARRIAGES AUSTRALIA—1983–2003

REMARRIAGE RATES

Remarriage rates for the divorced population have continued the downward trend. From 1986 to 2001 remarriage rates for divorced males have dropped from 94 (per 1,000 of the divorced male population) in 1986, to 74 in 1991, to 47 in 2001. Similarly, remarriage rates for divorced females have fallen from 70 (per 1,000 of the divorced female population) in 1986 to 57 in 1991, and to 34 in 2001.

Remarriage rates for the widowed population shrunk between 1986 and 2001. During this period remarriage rates for widowed males fell from 20 (per 1,000 of the widowed male population) in 1986, to 16 in 1991, and to 12 in 2001. However there is much less variation in the remarriage rates for widows. In 1986 the remarriage rate for widows was 5 (per 1,000 of the female widowed population) and 3 in 2001.

AGE AT MARRIAGE

The trend towards older ages at marriage continued in 2003. The median age at marriage (the age at which there are as many people marrying above the age as there are below it) for men was 31.2 years, rising from 28.8 years in 1993. For women the median age at marriage rose to 29.1 years from 26.4 years in 1993.

AGE AT MARRIAGE
continued

The median age at first marriage has increased for men from 27.0 years in 1993 to 29.2 years in 2003, and for women from 24.8 years to 27.3 years.

COHABITATION PRIOR TO MARRIAGE

Marriage data for 2003 confirms the thirty year trend for more Australian couples to cohabit prior to entering a registered marriage. In 1975, only 16% of couples cohabited prior to marriage, increasing to 27% in 1983, while 75% of couples cohabited prior to marriage in 2003.

In 2003, couples living in Tasmania were the most likely to cohabit before marriage (83% of all marriages) while those living in New South Wales were the least likely to cohabit prior to marriage (70% of all marriages).

FIRST MARRIAGES AND REMARRIAGES

In 2003, marriages in which neither party had been previously married comprised 66% of all marriages registered. A further 18% were first marriages for one partner and remarriage for the other, and 15% were remarriages for both partners. These proportions were similar to those recorded in 1983.

DIVORCES, AUSTRALIA

There were 53,100 divorces granted in Australia in 2003, representing a decrease of 2% (or 860 divorces) compared with divorces granted in 2002 (54,000). Divorces granted in 2003 were the third highest number granted in the last 20 years, with divorces granted in 2001 (55,300) being the highest. Divorces in 2003 represent an increase of 10% on the number granted 10 years ago (48,400) and 22% on the number granted 20 years ago (43,500).

DIVORCES GRANTED, Australia

AGE AT DIVORCE

The median age at divorce continued to increase in 2003. The median age of men at divorce was 42.6 years, up from 42.2 years in 2002 and 39.3 years in 1993. The median age of men at divorce has increased by 6.3 years over the last 20 years. For women, the median age at divorce for 2003 increased to 39.9 years, up from 39.5 years in 2002 and 36.4 years in 1993. The median age of women at divorce has increased by 6.2 years over the last 20 years.

AGE AT DIVORCE continued

The rise in the median age at divorce is associated with increasing age at first marriage and to some extent the increase in the interval between marriage and divorce. The median age at first marriage for males was 29.2 years in 2003, up from 29.0 years in 2002 and 27.0 years in 1993. For females, the median age at first marriage was 27.3 years in 2003, up from 27.1 years in 2002 and 24.8 years in 1993. More information about marriage statistics can be found in *Marriages, Australia 2003* (cat. no. 3306.0.55.001).

*DURATION OF MARRIAGE
FOR DIVORCING COUPLES*

The median duration of marriage to both separation and divorce is increasing over time, revealing that marriages are, on average, lasting longer. The median duration of marriage to separation in 2003 was 8.7 years, compared with 8.6 years in 2002 and 7.6 years in 1993. The median duration of marriage to divorce in 2003 was 12.2 years, compared with 12.0 years in 2002 and 10.7 years in 1993.

In 2003, 6% of divorces involved separation within the first year of marriage, 33% within the first five years and a further 22% were separated within five to nine years of marriage. Of the divorcing couples in 2003, 17% were married less than five years, 25% between five and nine years and 59% were married for 10 years or more. Around 16% of divorces occurred to couples who had been married for 25 years or more.

APPLICANT FOR DIVORCE

As in previous years, more women (43%) than men (32%) lodged applications for divorce in 2003. The remainder of divorces granted in 2003 (25%) were the result of joint applications. The median duration of marriage to divorce was shorter for female and joint applicants (each 11.5 years) than for male applicants (13.7 years).

*DIVORCES INVOLVING
CHILDREN*

Over the last 10 years, the proportion of divorces involving children under 18 years has fallen slightly from 53% in 1993 to 50% in 2003. The actual number of children involved in divorce in 2003 (49,900) was down 1% compared with 2002 (50,500) and up 4% compared with 1993 (48,100).

Of divorces involving children in 2003, the age of the youngest child was between 0 to 4 years of age for 26% of divorces, 5 to 9 years of age for 36% of divorces and 10 to 17 years of age for 38% of divorces.

POPULATION CHANGE, Summary(a)

Period	COMPONENTS OF POPULATION CHANGE				POPULATION

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) June quarter 2004 births for New South Wales are high due to a lag in registration processing in March quarter 2004. The backlog was cleared and included in June quarter 2004 estimates.

(c) September quarter 2004 birth registrations for the Northern Territory births appear to be lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.

.. not applicable

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) Differences between total growth and the sum of natural increase and net migration during 1996-2001 are due to intercensal discrepancy.

(c) June quarter 2004 births for New South Wales are high due to a lag in registration processing in March quarter 2004. The backlog was cleared and included in June quarter 2004 estimates.

(d) September quarter 2004 birth registrations for the Northern Territory births appear to be lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.

.. not applicable

— nil or rounded to zero (including null cells)

(a) For financial and calendar years growth is on previous year. For quarters growth is on previous quarter.

(b) Includes Other Territories from September 1993 onwards – see paragraph 2 of the Explanatory Notes.

(c) Differences between total growth and the sum of natural increase and net migration during 1996-2001 are due to intercensal discrepancy.

(d) June quarter 2004 births for New South Wales are high due to a lag in registration processing in March quarter 2004. The backlog was cleared and included in June quarter 2004 estimates.

(e) September quarter 2004 birth registrations for the Northern Territory appear lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.

ESTIMATED RESIDENT POPULATION, States and territories

At end of period	New South Wales	Victoria	Queensland(a)	South Australia	Western Australia	Tasmania	Northern Territory	Australian Capital Territory	Australia(b) (a)

(a) All data are 2001 census based.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) The high projections series assumes an increase in the Indigenous population observed between the 1996 and 2001 censuses which cannot be attributed to natural increase.

(d) The low projections series assumes changes in the Indigenous population as a result of natural increase and interstate migration.

- (a) Includes Other Territories from September 1993 – see paragraph 2 of the Explanatory Notes.
- (b) June quarter 2004 births for New South Wales are high due to a lag in registration processing in March quarter 2004. This backlog was cleared and included in June quarter 2004 estimates.
- (c) September quarter 2004 birth registrations for the Northern Territory appear to be lower than expected. This may indicate an irregular lag in birth registrations. Birth registrations for December quarter 2004 will be assessed when available.
- (d) Births per woman.

na not available

(a) Per 1,000 estimated resident population.

(b) Unmarried children of the marriage, aged under 18 years, see Glossary.

(c) Excludes divorces where country of birth of one or both partners is not stated. Country of birth not available for 2002 - see paragraph 11 of Explanatory Notes for more detail.

(d) Per 1,000 estimated resident males or females. Males under 18 years and females under 16 years are excluded from the population.

EXPLANATORY NOTES

INTRODUCTION

1 This quarterly publication contains the most recent estimates of the resident populations (ERP) of Australia and the states and territories based on the results of the Census of Population and Housing held on 7 August 2001 (with various adjustments described in paragraph 4). The publication also contains estimates of the number of households by household size as well as the latest available statistics of births, deaths (including infant deaths) and overseas and interstate migration. In addition, the publication includes estimates of the resident population by age and region, population projections for Australia and experimental estimates and projections of the Aboriginal and Torres Strait Islander population. Periodically, articles on specific demographic topics will be released on the ABS web site in conjunction with this publication.

2 Following the 1992 amendments to the *Acts Interpretation Act* to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state and territory level has been created, known as Other Territories. Other Territories include Jervis Bay Territory, previously included with the Australian Capital Territory, as well as Christmas Island and the Cocos (Keeling) Islands, previously excluded from population estimates for Australia. Data for Other and External Territories are detailed separately in table 7.

3 Estimates for Australian External Territories will be updated annually as at 30 June unless a more recent estimate is required for a determination under *Commonwealth Electoral Act 1918*.

POPULATION AND COMPONENTS OF POPULATION CHANGE

4 Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Demographic Estimates and Projections: Concepts, Sources and Methods*, Statistical Concepts Library, ABS web site, <<http://www.abs.gov.au>>.

Method of estimation

5 The estimated resident population is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the components of natural increase (on a usual residence basis) and net overseas migration. For the states and territories, account is also taken of estimated interstate movements involving a change of usual residence. Estimates of the resident population are based on census counts by place of usual residence, to which are added the estimated net census undercount and Australian residents estimated to have been temporarily overseas at the time of the census. Overseas visitors in Australia are excluded from this calculation.

6 After each census (at 30 June of the census year), estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the estimated resident populations at the two 30 June dates in the respective census years.

Natural increase: births and deaths

7 The births and deaths data in this release are shown by state and territory of usual residence, using year/quarter of occurrence for revised and final data and year/quarter of registration for preliminary data. This may affect comparison within relevant tables. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates, a factor has been applied to the number of occurrences to allow for these occurrences which are yet to be registered. For final estimates after 30 June 1991, year/quarter of occurrence data are used.

EXPLANATORY NOTES *continued*

Net overseas migration

8 Conceptually, net overseas migration (NOM) is the difference between permanent and long-term arrivals, and permanent and long-term departures. Estimates of NOM are derived from information provided on incoming and outgoing passenger cards, as well as other data supplied by the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Data on the intended duration of stay of overseas visitors arriving in Australia and the intended duration of absence of Australian residents travelling overseas are used to determine the numbers of permanent and long-term arrivals, and permanent and long-term departures. Passenger card data are also used to calculate migration adjustments and determine the state and territory distribution of NOM. The processes of adjusting movement data on travellers' stated intentions to reflect their actual behaviour are complex, and depend upon the amount and type of movement data available at a particular point in time. The methods currently used compare data on actual travel movements over a one year period with those first advised by individual travellers, and are explained in more detail in *Demography Working Paper 2003/5 - Net Overseas Migration: Adjusting for Actual Duration of Stay or Absence* <<http://www.abs.gov.au>>. In order to conduct such a comparison, data for a 15 month period (i.e. one year plus one quarter) are required. The adjustment methods described in the working paper have been applied to NOM data from the September quarter 2001 onwards and will be subject to further investigation and improvement with the accumulation of additional data and time series. For more information see the *Technical Note—Measuring Net Overseas Migration*.

Net interstate migration

9 Estimates of interstate migration since June 1986 have been derived from the latest census data on interstate movement in the preceding one year and unidentified information on interstate changes of address advised to the Health Insurance Commission in the process of administering Medicare.

CORRECTION OF PRISON DATA FOR QUEENSLAND

10 For the 2001 Census of Population and Housing, most prison data was received for processing via electronic data files. During the post-processing evaluation cycle, it was established that the male and female counts for Queensland prisons (only) were incorrectly captured. This resulted in the publication of incorrect census counts for males and females for various Queensland geographical areas and, as a consequence the incorrect numbers for males and females for Queensland and Australia. Revised population estimates for the 2001–02 financial year phased in a correction for this error. Information on the geographical areas affected are available in the *2001 Census Working Paper—Fact Sheet: Correction of Prison Data for Queensland* on the ABS web site <<http://www.abs.gov.au>>.

RATES OF POPULATION GROWTH

11 The average annual growth rate, r , is calculated as a percentage using the formula:

$$\left[\left(\frac{P_n}{P_0} \right)^{\frac{1}{n}} - 1 \right] \times 100$$

where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_n and P_0 in years.

EXPERIMENTAL ESTIMATES OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION

12 Estimates of the Indigenous population are experimental in that the standard approach to population estimation is not possible because satisfactory data on births, deaths and internal migration are not generally available. Furthermore, there is significant intercensal volatility in census counts of the Indigenous population, thus adding to the problem of estimating the true Indigenous population. This volatility can in part be attributed to changes to the Indigenous population that can not be attributed to natural increase or interstate migration. As a result, a method based on the use of life tables is used to produce time series data. For further details see *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians* (cat. no. 3238.0).

EXPLANATORY NOTES *continued*

EXPERIMENTAL PROJECTIONS OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION

13 Experimental estimates of the Indigenous population as at 30 June 2001 are used as the base population for projections of the Indigenous population to 30 June 2009. A low and a high projection series have been generated, and respectively imply a low and high overall growth rate of the Indigenous population. The low series assumes a change to the Indigenous population is a result of natural increase and, for states and territories, a result of interstate migration. The high series assumes an increase in the Indigenous population observed between the 1996 and 2001 censuses which cannot be attributed to natural increase. For further details see *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 1991–2009* (cat. no. 3238.0).

ESTIMATED RESIDENT HOUSEHOLDS

14 Estimates of households are based on the estimated resident population series, to which propensities to form households are applied. These propensities were estimated from the Census of Population and Housing, and updated using the monthly Labour Force Survey. A detailed description of the method used to produce household estimates is contained in *Household Estimates 1986, 1991–94* (cat. no. 3229.0).

OVERSEAS ARRIVALS AND DEPARTURES ESTIMATION METHOD

15 Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated and processed. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed.

16 From July 1998 the DIMIA is able to determine the actual length of stay for departing overseas visitors and arriving Australian residents which was previously collected from information on intended length of stay supplied on the arrival or departure card by the passenger. This new method has resulted in a change in data distribution with the number of passengers staying for one year exactly declining significantly.

POPULATION PROJECTIONS

17 Population projections presented in this publication are not predictions or forecasts. They are an assessment of what would happen to Australia's population if the assumed levels of components of population change – births, deaths and migration – were to hold for the next 50–100 years.

18 The ERP at June 2002 is the base for the projections series. The three series published in this publication and their assumptions are as follows:

- Series A – assumes that the total fertility rate (TFR) will reach 1.8 babies per woman by 2011 and then remain constant, life expectancy at birth will continue to improve through to 2050–51 reaching 92.2 years for males and 95.0 years for females, net overseas migration (NOM) of 125,000 per year from 2005–06 through to 2050–51, and high flows of interstate migration.
- Series B – assumes that the TFR will fall to 1.6 babies per woman by 2011 and then remain constant, life expectancy at birth will continue to improve each year, though at a declining rate, and will reach 84.2 years for males and 87.7 year for females in 2050–51, NOM of 100,000 per year from 2005–06 through to 2050–51, and medium flows of interstate migration.
- Series C – assumes that the TFR will fall to 1.4 babies per woman by 2011 and then remain constant, life expectancy at birth will continue to improve each year, though at a declining rate, and will reach 84.2 years for males and 87.7 years for females in 2050–51, NOM of 70,000 per year from 2005–06 through to 2050–51, and small flows of interstate migration.

For additional series and information (e.g. age, sex, states/territories and capital cities/balances of state) see *Population Projections, Australia, 2002–2101* (cat. no. 3222.0).

EXPLANATORY NOTES *continued*

ROUNDING

19 In this publication population estimates and their components have sometimes been rounded to the nearest hundred. Neither rounded figures nor unrounded figures should be assumed to be accurate to the last digit shown.

20 Where figures have been rounded, discrepancies may occur between sums of component items and totals.

ADDITIONAL STATISTICS AVAILABLE

22 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. Inquiries should be made to the National Information and Referral Service on 1300 135 070.

23 AusStats is a web based information service which provides ABS full standard product range online. It also includes companion data in multidimensional datasets in SuperTABLE format, and time series spreadsheets.

24 Current publications and other products released by the ABS are listed in the *Catalogue of Publications and Products* (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <<http://www.abs.gov.au>>. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

25 Statistics of overseas arrivals and departures and related data are also published regularly by DIMIA (see the Department's quarterly publication, Immigration Update) and by the Bureau of Tourism Research (on international travel and tourism).

TECHNICAL NOTE MEASURING NET OVERSEAS MIGRATION

BACKGROUND

1 Estimates of the Australian population are generated on a quarterly basis by adding natural increase (the excess of births over deaths) and net overseas migration (NOM) occurring during the period to the population at the beginning of each period. This is known as the cohort component method, and can be represented by the following equation:

$P_{(t+1)} = P_{(t)} + B - D + \text{NOM}$, where:

$P_{(t)}$ = the estimated resident population at time point t

$P_{(t+1)}$ = the estimated resident population at time point $t+1$

B = the number of births occurring between t and $t+1$

D = the number of deaths occurring between t and $t+1$

NOM = net overseas migration occurring between t and $t+1$.

2 For state and territory population estimates, an additional term is added to the equation representing net interstate migration occurring between t and $t+1$.

3 Net overseas migration accounts for around half of population growth at the national level. This note outlines how the ABS calculates NOM estimates by state and territory, including adjustments made to overcome some limitations of existing migration data.

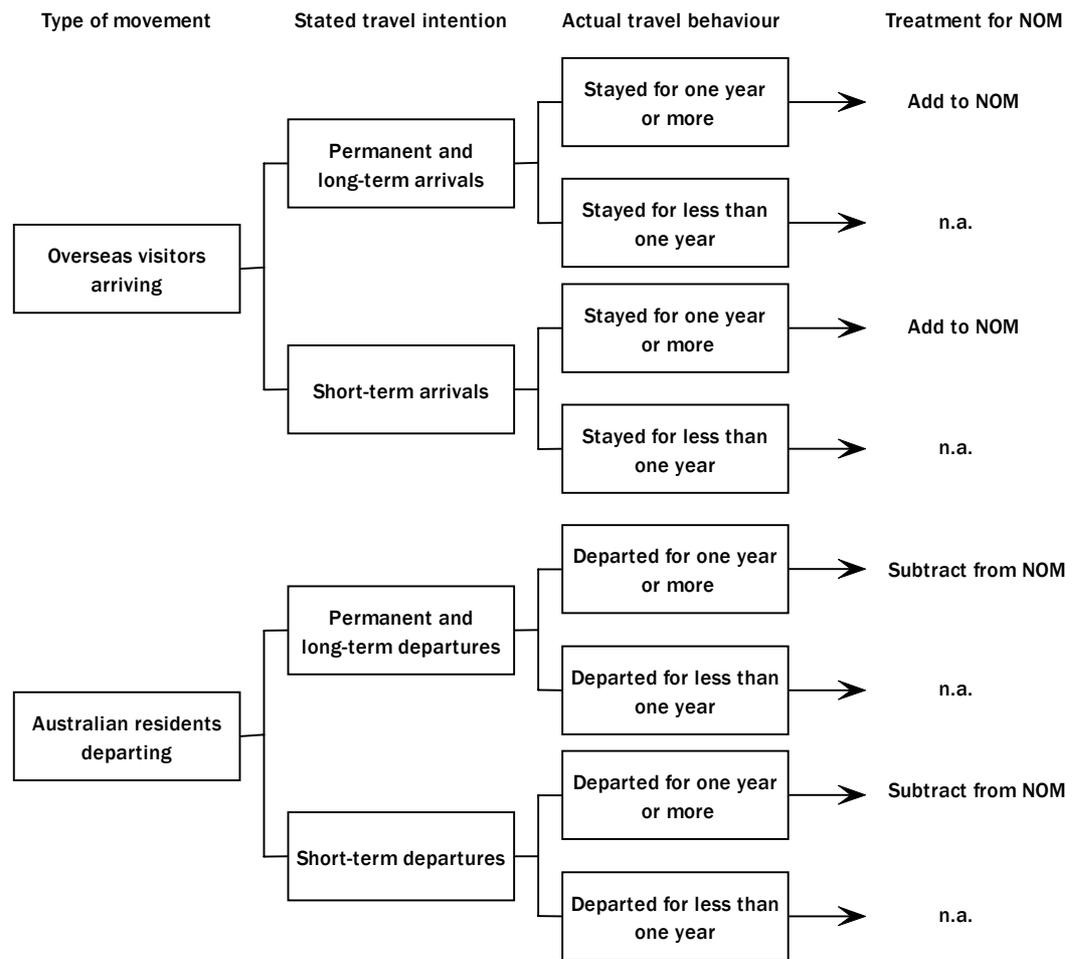

4 The ABS estimates the level of NOM occurring during each quarter using data on incoming (i.e. arriving) and outgoing (i.e. departing) passenger movements at Australian air and sea ports. These movements are classified into three main categories depending on the stated duration of stay in Australia or overseas:

- permanent movement
- long-term (one year or more) movement
- short-term (less than one year) movement.

5 Conceptually, NOM is the difference between permanent and long-term arrivals, and permanent and long-term departures. However, at the time a person crosses the Australian border, it is not empirically known how long they will actually spend in Australia or overseas. For example, overseas visitors might change their travel plans and extend their stay in Australia (perhaps utilising on-shore visa grants), or depart earlier than they first intended. Similarly, Australian residents travelling overseas may change their plans while abroad (e.g. some might state that they are departing the country permanently, but return less than a year later, while others might stay overseas longer than they initially intended).

6 Some of these differences between stated travel intentions and actual travel behaviour may also reflect short interruptions to longer periods of stay or absence. For example, overseas students arriving in Australia might state that they intend to stay for three years, but return home for brief periods during this time. Similarly, Australians working or studying overseas might state that they intend to be away for more than a year but return for brief holidays.

7 The following diagram summarises the contributions of different types of overseas movements to NOM. Estimates of NOM are derived from information provided on incoming and outgoing passenger cards, as well as other data supplied by the DIMIA. Data on the intended duration of stay of overseas visitors arriving in Australia and the intended duration of absence of Australian residents travelling overseas are used to determine the numbers of permanent and long-term arrivals, and permanent and long-term departures. Passenger card data are also used to calculate migration adjustments and determine the state and territory distribution of NOM.

Migration adjustments

8 The ABS applies a number of adjustments to overseas arrivals and departures data in order to produce estimates of NOM. These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour, but (in the case of revised NOM estimates) also include adjustments to transform numbers of overseas movements into numbers of travellers. These adjustments are collectively referred to as 'migration adjustments', although they have also been referred to in the past as 'category jumping' adjustments.

9 The processes of adjusting movement data on travellers' stated intentions to reflect their actual behaviour are complex, and depend upon the amount and type of movement data available at a particular point in time. The methods currently used compare data on actual travel movements over a one year period with those first advised by individual travellers, and are explained in more detail in *Demography Working Paper 2003/5 - Net Overseas Migration: Adjusting for Actual Duration of Stay or Absence* (<<http://www.abs.gov.au>>, select Themes > Demography > ABS Demography Working Papers). In order to conduct such a comparison, data for a 15 month period (i.e. one year plus one quarter) are required. These adjustment methods described in the working paper have been applied to NOM data from the September quarter 2001 onwards and will be subject to further investigation and improvement with the accumulation of additional data and time series.

10 Table 1 describes the impact that various types of migration adjustments have on NOM estimates. The adjustments applied to preliminary and revised NOM estimates are described in more detail elsewhere in this document.

1. MIGRATION ADJUSTMENTS APPLIED TO NOM ESTIMATES

<i>Migration Adjustment</i>	<i>Treatment in adjusted estimates</i>
-----------------------------	--

ADJUSTMENTS MADE TO PRELIMINARY NOM ESTIMATES

Persons whose stated travel intentions differed from actual travel behavior(a)	
Long-term visitor arrivals assumed to be staying in Australia short-term	Subtract from NOM
Long-term resident departures assumed to be staying overseas short-term	Add to NOM
Short-term visitor arrivals assumed to be staying in Australia long-term	Add to NOM
Short-term resident departures assumed to be staying overseas long-term	Subtract from NOM

ADJUSTMENTS MADE TO REVISED NOM ESTIMATES

Persons whose stated travel intentions differed from actual travel behaviour(b)	
Permanent arrivals who actually stayed in Australia short-term	Subtract from NOM
Permanent departures who actually stayed overseas short-term	Add to NOM
Long-term visitor arrivals who actually stayed in Australia short-term	Subtract from NOM
Long-term resident departures who actually stayed overseas short-term	Add to NOM
Short-term visitor arrivals who actually stayed in Australia long-term	Add to NOM
Short-term resident departures who actually stayed overseas long-term	Subtract from NOM
Multiple movements of travellers	Subtract from NOM(c)

- (a) Based on trends observed for the proportions of long-term and short-term arrivals and departures who change their travel behaviour.
- (b) Based on matched passenger records comparing stated travel intentions with actual behaviour.
- (c) Numbers of movements are converted into numbers of persons by matching passport numbers and other identifying personal details.

State and territory distribution of NOM

11 The state or territory distribution of NOM is based on information reported by travellers on arrival in or on departure from Australia. Incoming passenger cards provide information on the state or territory of a traveller's intended address within Australia, while outgoing passenger cards provide information on the state or territory in which a traveller lives or spent most time. However, the way in which this distribution is calculated differs between preliminary and revised estimates of NOM due to the amount of data available.

12 The following sections of this document describe how preliminary and revised estimates of NOM are created and distributed between states and territories. Estimates of NOM are finalised after the five-yearly Census of Population and Housing.

PRELIMINARY NOM ESTIMATES

13 The ABS produces quarterly estimates of Australia's resident population (known as the ERP) five to six months after the end of the reference quarter, and is required under legislation to provide population estimates as at 31 December by early June of the following year. Since estimates of NOM (adjusted for actual travel behaviour) require 15 months of data, preliminary estimates of NOM are calculated to meet more immediate ERP requirements.

Migration adjustments

14 There are four main groups of travellers who provide an intended duration of stay on their passenger cards who have the potential to change their duration of stay or absence:

- long-term overseas visitors who stayed in Australia for less than 12 months (i.e. long-term visitors who stayed in Australia short-term)
- short-term overseas visitors who stayed in Australia for 12 months or more (i.e. short-term visitors who stayed in Australia long-term)
- Australian residents departing long-term who stayed overseas for less than 12 months (long-term departures who stayed overseas short-term)

Migration adjustments
continued

- Australian residents departing short-term who stayed overseas for 12 months or more (short-term departures who stayed overseas long-term).

15 Migration adjustments applied to preliminary NOM estimates are based on the trends observed for the proportions of long-term and short-term arrivals and departures who change their travel behaviour. Table 2 shows the proportion of long-term and short-term travellers in 2002-03 who had changed their stated travel intentions. Preliminary migration adjustments are only applied to the four major movement categories (i.e. long-term visitor arrivals, short-term visitor arrivals, long-term visitor departures and short-term resident departures).

2. CHANGES IN TRAVEL BEHAVIOUR(a), Selected categories of movement(b)—September quarter 2002 to June quarter 2003

Period	LONG-TERM		SHORT-TERM	
	Arrivals	Departures	Arrivals	Departures
	%	%	%	%
2002				
September	71.8	51.5	3.7	3.0
December	70.5	49.8	2.9	2.9
2003				
March	71.3	55.0	3.8	3.7
June	69.3	50.0	2.7	3.1
Average	70.7	51.6	3.3	3.2

- (a) Proportion of travellers whose actual duration of stay or absence differed from their stated intentions.
(b) Based on stated intentions.

16 An average adjustment based on the most recent complete financial year for which 15 months of data exist is applied to each new quarter of movement data. For example, preliminary NOM estimates for the September quarter 2004 assumed that, based on the 2002-03 evidence, 70.7% of long-term visitor arrivals during the quarter would in fact stay in Australia for less than 12 months, while 51.6% of long-term resident departures would return to Australia within 12 months. These preliminary data are expected to be revised in the March 2005 issue of *Australian Demographic Statistics* (cat. no. 3101.0).

17 Table 3 shows how the preliminary NOM estimate for the September quarter 2004 was calculated.

TECHNICAL NOTE MEASURING NET OVERSEAS MIGRATION *continued*

Migration adjustments
continued

3. COMPONENTS OF NET OVERSEAS MIGRATION, Original and adjusted estimates—September quarter 2004

<i>Initial category of movement</i>	ORIGINAL	MIGRATION		ADJUSTED
	ESTIMATE	ADJUSTMENT(a)	%	ESTIMATE FOR PRELIMINARY NOM
	<i>no.</i>	<i>no.</i>	<i>%</i>	<i>no.</i>
Permanent movement				
Permanent (settler) arrivals	31 028	31 028
Permanent departures	-14 861	-14 861

(a) Refer to table 1 in this document for further information on the migration adjustments applied to preliminary NOM estimates.

State and territory distribution

18 As noted in paragraph 10, the state or territory distribution of NOM is based on information reported by travellers on arrival in or on departure from Australia. However, at the time preliminary NOM estimates are calculated, information on the state or territory in which long-time arrivals will actually spend most time in is not available because outgoing passenger cards for these persons have not yet been completed. State and territory distributions of long-term arrivals therefore refer to the state or territory of their intended addresses, as advised on incoming passenger cards. Similarly, state and territory distributions of permanent arrivals refer to their intended addresses as advised on incoming passenger cards, which may differ from the state or territory where they settle in the long term.

19 The state and territory distribution of preliminary migration adjustments for a particular quarter is assumed to be the same as that of permanent and long-term arrivals in the same quarter. In practice, a national total is calculated for the migration adjustment. This is then distributed across the states and territories, by age and sex, using the distribution of permanent and long-term arrivals by state or territory of intended address. For example, since 25.2% of all permanent and long-term arrivals in the September quarter 2004 intended to live in Victoria, 25.2% of the total migration adjustment (-5,627) is also applied to this state. Table 4 shows components of net overseas migration for September quarter 2004 by state and territory.

4. COMPONENTS OF NET OVERSEAS MIGRATION, States and territories—September quarter 2004

Category of movement	NSW	Vic.	Qld	SA	WA	Tas.	NT	ACT	Aust. (a)
Permanent and long-term arrivals	42 277	27 157	17 706	4 804	11 811	931	825	2 211	107 725
Permanent and long-term departures	23 653	12 408	10 098	2 435	5 577	595	514	1 697	56 979
Migration adjustment	-8 760	-5 627	-3 669	-996	-2 447	-193	-171	-458	-22 321
Net overseas migration	9 864	9 122	3 939	1 373	3 787	143	140	56	28 425

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

*State and territory distribution
continued*

20 The current method of distributing the preliminary migration adjustment across states and territories is the same as that which has been previously used for preliminary category jumping estimates (see paragraph A3.24 of *Demographic Estimates and Projections: Concepts, Sources and Methods* (cat. no. 3228.0), available from the ABS web site).

21 However, the ABS plans to review this method, with the prospect of applying a distribution method which allows for positive as well as negative adjustments for individual states and territories. In the interim, the preliminary estimates of NOM are subject to revision when more complete data are available.

REVISED NOM ESTIMATES

22 Preliminary estimates of NOM for a financial year are usually revised in the following March issue of *Australian Demographic Statistics* (cat. no. 3101.0). These revised NOM estimates use matched passenger records to calculate the actual duration of stay relating to overseas movements. Migration adjustments applied to NOM estimates are based on these matched data and include, in addition to the four major movement categories previously identified, a subset of movements relating to permanent arrivals and permanent departures:

- permanent (settler) arrivals who arrived in and left Australia in the same quarter, and did not return at any point during the 12 months following this arrival
- permanent departures who left and returned to Australia in the same quarter, and did not depart at any point during the 12 months following this departure.

23 Migration adjustments applied to revised NOM estimates also adjust for multiple movements of travellers (i.e. converting numbers of movements into numbers of persons).

24 The current methodology for these revised migration adjustments has been applied from the September quarter 2002 to June quarter 2003. Table 5 shows how revised NOM estimates were calculated for 2002–03.

Visitors arrivals	4 655 803	154 312	154 312
Residents arrivals	3 309 851	..	3 309 851
Visitors departures	4 714 637	..	4 714 637
Residents departures	3 293 337	-103 915	-103 915
Net overseas migration	154 225	-37 727	116 498

.. not applicable

(a) Refer to table 1 in this document for further information on the migration adjustments applied to revised NOM estimates.

State and territory distribution

25 As is the case for preliminary NOM estimates, the state and territory distribution of revised NOM estimates is determined based on information reported on incoming and outgoing passenger cards (i.e. state or territory of intended address for arrivals and state or territory of residence/spent most time for departures).

26 The state and territory distributions of the migration adjustment are calculated based on the initial passenger card that identifies the movement of the traveller. For example, a long-term resident departure who returned to Australia within twelve months is added back to the state of residence they reported on departure (as identified on their outgoing passenger card). A long-term visitor arrival who actually stayed in Australia for less than twelve months is taken away from the state or territory they intended to live in (as identified on their incoming passenger card).

27 This method may be considered to be reasonable for people who, on arrival, intend to settle or stay in Australia for more than twelve months. However, there is less certainty about the reliability of the state or territory of intended stay for those persons who originally stated that they intended to stay for less than twelve months, but actually stayed longer, and this component of the migration adjustment is treated differently.

28 In the absence of direct information from outgoing passenger cards for this group, the ABS has applied the state and territory distribution for short-term visitors departing Australia who were in Australia for between six and twelve months. The state and territory distributions used for revised NOM estimates (shown in table 6) are still subject to revision. The ABS expects that these estimates will improve as investigations proceed, and as actual data on state or territory of stay becomes available for this segment of the overseas visitor population (i.e. as outgoing passenger cards become available).

Net overseas migration	40 919	26 777	27 122	3 904	15 575	1 014	325	885	116 498

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

CHANGES TO MIGRATION ADJUSTMENT METHODS

29 Due to changes in the methods used to adjust NOM estimates, caution should be used when comparing estimates over time. Table 7 describes the adjustment methods that have been applied to NOM estimates since September quarter 1996 (i.e. since the last intercensal period). Adjustments applied to overseas migration estimates have also been discussed in a special article in *Migration, Australia*, 2002–03 (cat. no. 3412.0).

7. MIGRATION ADJUSTMENT METHODS—September quarter 1996 to September quarter 2004

Period	Adjustment method
September 1996 – June 1997	Category jumping' adjustments applied using previous methodology(a)
September 1997 – June 2001	No adjustments applied (i.e. 'category jumping' set to zero)
September 2001 – June 2003	Current migration adjustments used (revised NOM estimates)
September 2003 – September 2004	Current migration adjustments methods used (preliminary NOM estimates)

(a) For further information, refer to Appendix 3 in *Demographic Estimates and Projections: Concepts, Sources and Methods* (cat. no. 3228.0).

FURTHER INFORMATION

30 For further information on the measurement of net overseas migration, contact Rhonda de Vos on Canberra (02) 6252 6639, email <rhonda.devos@abs.gov.au>.

GLOSSARY

Age-specific fertility rates	Age-specific fertility rates are the number of live births (occurred or registered) during the calendar year, according to age of mother, per 1,000 of the female estimated resident population of the same age at 30 June. For calculating these rates, births to mothers under 15 years are included in the 15–19 years age group, and births to mothers aged 50 years and over are included in the 45–49 years age group. Pro rata adjustment is made in respect of births for which age of mother is not given.
Average annual rate of growth	The average annual growth rate, r , is calculated as a percentage using the formula: $\left[\left(\frac{P_n}{P_0} \right)^{\frac{1}{n}} - 1 \right] \times 100$ where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_n and P_0 in years.
Average household size	Average household size refers to the number of persons per household in private dwellings.
Birth	The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as heartbeat.
Category of movement	Overseas arrivals and departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: <ul style="list-style-type: none">■ permanent movements■ long-term movements (one year or more)■ short-term movements (less than one year). A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly, in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Estimated resident population (ERP)	The official measure of the population of Australia is based on the concept of residence. It refers to all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months. It excludes overseas visitors who are in Australia for less than 12 months.
Household	A household is a group of two or more related or unrelated people who usually reside in the same dwelling, who regard themselves as a household and who make common provision for food or other essentials for living; or a person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person. Households include group households of unrelated persons, same-sex couple households, single-parent households as well as one-person households. A household usually resides in a private dwelling (including caravans etc. in caravan parks). Persons usually resident in non-private dwellings, such as hotels, motels, boarding houses, jails and hospitals, are not included in household estimates. This definition of a household is consistent with the definition used in the census. The number of households can be either based on count or estimated resident population.
Household estimate	Household estimate is a measure of the number of households of the usually resident population. It is based on the census count of households which is adjusted for missed households, households of overseas visitors, households of Australian residents where all members were temporarily overseas at the time of the census and households of

GLOSSARY *continued*

Household estimate <i>continued</i>	Australian residents where all members were not home on census night and spent census night in a non-private dwelling in Australia.
Household population	The household population is the estimated resident population (ERP) that usually lives in private dwellings. It is the ERP less the population that usually lives in non-private dwellings.
Household size	Household size refers to the number of persons per household.
Infant mortality rate	The number of deaths of children under one year of age in a financial year per 1,000 live births in the same financial year.
Intercensal discrepancy	Intercensal discrepancy is the difference between two estimates at 30 June of a census year population, the first based on the latest census and the second arrived at by updating the 30 June estimate of the previous census date estimate with intercensal components of population change which take account of information available from the latest census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source.
Intercensal error	Intercensal error is the difference between two estimates at 30 June of a census year population, the first based on the latest census and the second arrived at by updating the 30 June estimate of the previous census year with intercensal components of population change which do not take account of information available from the latest census.
Long-term arrivals	Long-term arrivals comprise: <ul style="list-style-type: none">■ overseas visitors who intend to stay in Australia for 12 months or more (but not permanently)■ Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	Long-term departures comprise: <ul style="list-style-type: none">■ Australian residents who intend to stay abroad for 12 months or more (but not permanently)■ overseas visitors departing who stayed 12 months or more in Australia.
Migration Adjustment	The ABS applies a number of adjustments to overseas arrivals and departures data in order to produce estimates of net overseas arrivals and departures (NOM). These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour, but (in the case of revised NOM estimates) also include adjustments to transform numbers of overseas movements into numbers of travellers. These adjustments are collectively referred to as 'migration adjustments', although they have been referred to in the past as 'category jumping' adjustments.
Natural increase	Excess of births over deaths.
Net interstate migration	The difference between the number of persons who have changed their place of usual residence by moving into a given state or territory and the number who have changed their place of usual residence by moving out of that state or territory during a specified time period. This difference can be either positive or negative.
Net overseas migration	Net overseas migration is net permanent and long-term overseas migration, adjusted for change in traveller duration, intention and multiple movement error.
Net permanent and long-term movement	The difference between the number of permanent (settler) and long-term arrivals and the number of permanent and long-term departures. Short-term movements are excluded.
Overseas arrivals and departures (OAD)	Overseas arrivals and departures (OAD) refer to the arrival or departure of persons, through Australian airports (or sea ports), which have been recorded. Statistics on OAD relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).

GLOSSARY *continued*

Permanent arrivals (settlers)	<p>Permanent arrivals (settlers) comprise:</p> <ul style="list-style-type: none">■ travellers who hold migrant visas (regardless of stated intended period of stay)■ New Zealand citizens who indicate an intention to settle■ those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens). <p>This definition of settlers is used by the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Prior to 1985 the definition of settlers used by the Australian Bureau of Statistics (ABS) was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the DIMIA.</p>
Permanent departures	<p>Permanent departures are Australian residents (including former settlers) who on departure state that they are departing permanently.</p>
Population growth	<p>For Australia, population growth is the sum of natural increase and net overseas migration. For states and territories, population growth also includes net interstate migration. After the census, intercensal population growth also includes an allowance for intercensal discrepancy.</p>
Population projections	<p>Population projections are not predictions or forecasts. They are an assessment of what would happen, in future years, to Australia's population given a set of assumptions about future trends in fertility, mortality and migration.</p>
Short-term arrivals	<p>Short-term arrivals comprise:</p> <ul style="list-style-type: none">■ overseas visitors who intend to stay in Australia for less than 12 months■ Australian residents returning after a stay of less than 12 months overseas.
Short-term departures	<p>Short-term departures comprise:</p> <ul style="list-style-type: none">■ Australian residents who intend to stay abroad for less than 12 months■ overseas visitors departing after a stay of less than 12 months in Australia.
Standardised death rate	<p>Standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The ABS standard populations relate to the years ending in 1 (e.g. 1991). The current standard population is all persons in the Australian population at June 2001. They are expressed per 1,000 or 100,000 persons. There are two methods of calculating standardised death rates:</p> <ul style="list-style-type: none">■ The <i>direct method</i> – this is used when the populations under study are large and the age-specific death rates are reliable. It is the overall death rate that would have prevailed in the standard population if it had experienced at each age the death rates of the population under study.■ The <i>indirect method</i> – this is used when the populations under study are small and the age-specific death rates are unreliable or not known. It is an adjustment to the crude death rate of the standard population to account for the variation between the actual number of deaths in the population under study and the number of deaths which would have occurred if the population under study had experienced the age-specific death rates of the standard population. <p>Wherever used, the definition adopted is indicated.</p>
State or territory and Statistical Local Area of usual residence	<p>State or territory and Statistical Local Area (SLA) of usual residence refers to the state or territory and SLA of usual residence of:</p> <ul style="list-style-type: none">■ the population (estimated resident population)■ the mother (birth collection)■ the deceased (death collection). <p>In the case of overseas movements, state or territory of usual residence refers to the state or territory regarded by the traveller as the one in which he/she lives or has lived. State or territory of intended residence is derived from the intended address given by settlers, and by Australian residents returning after a journey abroad. Particularly in the</p>

GLOSSARY *continued*

State or territory and Statistical Local Area of usual residence <i>continued</i>	case of the former, this information does not necessarily relate to the state or territory in which the traveller will eventually establish a permanent residence.
Statistical District (S Dist)	Statistical Districts (S Dist) consist of selected, significant, predominantly urban areas in Australia which are not located within a Capital City Statistical Division (SD). S Dists enable comparable statistics to be produced about these selected urban areas. Further information concerning S Dists is contained in <i>Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Division (SD)	Statistical Divisions (SD) consist of one or more Statistical Subdivisions (SSD). The divisions are designed to be relatively homogeneous regions characterised by identifiable social and economic units within the region, under the unifying influence of one or more major towns or cities. Further information concerning SDs is contained in <i>Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Local Area (SLA)	Statistical Local Areas (SLA) are, in most cases, identical with, or have been formed from a division of, whole Local Government Areas (LGA). In other cases, they represent unincorporated areas. In aggregate, SLAs cover the whole of a state or territory without gaps or overlaps. In some cases legal LGAs overlap statistical subdivision boundaries and therefore comprise two or three SLAs (Part A, Part B and, if necessary, Part C). Further information concerning SLAs is contained in <i>Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Statistical Subdivision (SSD)	Statistical Subdivisions (SSD) are of intermediate size, between Statistical Local Areas (SLA) and Statistical Divisions (SD). In aggregate, they cover the whole of Australia without gaps or overlaps. They are defined as socially and economically homogeneous regions characterised by identifiable links between the inhabitants. In the non-urban areas an SSD is characterised by identifiable links between the economic units within the region, under the unifying influence of one or more major towns or cities. Further information concerning SSDs is contained in <i>Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Total fertility rate (TFR)	The sum of age-specific fertility rates. It represents the number of children a woman would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life.
